

# Contents

Preface	xvii
<b>1 Overview</b>	<b>1</b>
<b>1.1 Condensed matter physics</b>	<b>1</b>
<b>1.2 An example - H<sub>2</sub>O</b>	<b>3</b>
1 Gaseous and liquid states	3
2 The liquid-gas phase transition	4
3 Spatial correlations in the liquid state	5
4 Ice – crystallized water	8
5 Broken symmetry and rigidity	10
6 Dislocations – topological defects	12
7 Universality of the water example	13
8 Fluctuations and spatial dimension	15
9 Overview of book	16
<b>1.3 Energies and potentials</b>	<b>17</b>
1 Energy scales	17
2 Van der Waals attraction	18
3 Molecular hydrogen – the Heitler-London approach	20
4 Hard-sphere repulsion	22
5 Exchange interaction and magnetism	24
6 The hydrogen molecule, molecular orbitals, and bands in metals	25
Bibliography	28
References	28
<b>2 Structure and scattering</b>	<b>29</b>
<b>2.1 Elementary scattering theory – Bragg's law</b>	<b>29</b>
<b>2.2 Photons, neutrons, or electrons</b>	<b>33</b>
<b>2.3 The density operator and its correlation functions</b>	<b>34</b>
<b>2.4 Liquids and gases</b>	<b>38</b>
1 Hard-sphere liquids	40
<b>2.5 Crystalline solids</b>	<b>43</b>
1 Unit cells and the direct lattice	43
2 The reciprocal lattice	45

3	Periodic functions	46
4	Bragg scattering	47
<b>2.6</b>	<b>Symmetry and crystal structure</b>	49
1	Two-dimensional Bravais lattices	50
2	Three-dimensional Bravais lattices	53
3	Close packed structures	56
4	Space groups	57
<b>2.7</b>	<b>Liquid crystals</b>	58
1	Isotropic, nematic and cholesteric phases	58
2	Smectics-A and -C	61
3	Hexatic phases	65
4	Discotic phases	68
5	Lyotropic liquid crystals and microemulsions	68
<b>2.8</b>	<b>One- and two-dimensional order in three-dimensional materials</b>	71
<b>2.9</b>	<b>Incommensurate structures</b>	77
<b>2.10</b>	<b>Quasicrystals</b>	82
<b>2.11</b>	<b>Magnetic order</b>	85
<b>2.12</b>	<b>Random isotropic fractals</b>	90
<b>Appendix 2A Fourier transforms</b>		97
1	One dimension	97
2	$d$ dimensions	99
3	Transforms on a lattice	100
<b>Bibliography</b>		101
<b>References</b>		102
<b>Problems</b>		103
<b>3</b>	<b>Thermodynamics and statistical mechanics</b>	108
<b>3.1</b>	<b>Thermodynamics of homogeneous fluids</b>	108
1	The first law of thermodynamics	109
2	The second law of thermodynamics	111
3	The third law of thermodynamics	111
4	Thermodynamic potentials	112
5	Stability criteria	113
6	Homogeneous functions	115
7	Equations of state	116
<b>3.2</b>	<b>Statistical mechanics: phase space and ensembles</b>	117
<b>3.3</b>	<b>The ideal gas</b>	122
<b>3.4</b>	<b>Spatial correlations in classical systems</b>	123
<b>3.5</b>	<b>Ordered systems</b>	127
<b>3.6</b>	<b>Symmetry, order parameters, and models</b>	132
1	Discrete symmetries	135
2	Continuous symmetries	137

<b>3 Models</b>	139
<b>Appendix 3A Functional derivatives</b>	140
Bibliography	142
References	142
Problems	142
<b>4 Mean-field theory</b>	144
<b>4.1 Bragg-Williams theory</b>	146
<b>4.2 Landau theory</b>	151
<b>4.3 The Ising and <math>n</math>-vector models</b>	152
1 The nonlocal susceptibility and the correlation length	154
2 $O_n$ symmetry	156
3 Some mean-field transitions	157
<b>4.4 The liquid-gas transition</b>	159
1 The critical point and the critical isochore	162
2 The coexistence curve	165
<b>4.5 The first-order nematic-to-isotropic transition</b>	168
<b>4.6 Multicritical points</b>	172
1 Tricritical points	173
2 Metamagnets and $\text{FeCl}_2$	175
3 $\text{He}^3 - \text{He}^4$ mixtures and the Blume-Emery-Griffiths model	179
4 Bicritical and tetracritical points	181
5 Lifshitz points	184
<b>4.7 The liquid-solid transition</b>	188
1 Are all crystals BCC?	189
2 Criterion for freezing	192
3 Improvements of the theory	192
4 Changes in density	194
5 Density functional theory	195
<b>4.8 Variational mean-field theory</b>	198
1 Two inequalities	198
2 The mean-field approximation	200
3 The $s$ -state Potts model	201
4 The $O_n$ classical Heisenberg model	202
5 Debye-Hückel theory	204
Bibliography	208
References	209
Problems	209
<b>5 Field theories, critical phenomena, and the renormalization group</b>	213
<b>5.1 Breakdown of mean-field theory</b>	214

1	Mean-field transitions revisited	216
<b>5.2</b>	<b>Construction of a field theory</b>	217
1	Coarse graining	217
2	Lattice field theories and their continuum limit	219
3	Gaussian integrals	221
4	Mean-field theory from functional integrals	223
5	Breakdown of mean-field theory revisited	225
<b>5.3</b>	<b>The self-consistent field approximation</b>	226
1	The $n$ -vector model in the limit $n \rightarrow \infty$	229
<b>5.4</b>	<b>Critical exponents, universality, and scaling</b>	230
1	Exponents and scaling relations	230
2	Scaled equation of state	234
3	Multicritical points	235
4	Amplitude ratios	236
5	Theoretical calculations of critical exponents and amplitude ratios	237
<b>5.5</b>	<b>The Kadanoff construction</b>	237
<b>5.6</b>	<b>The one-dimensional Ising model</b>	242
1	Exact solution	242
2	Decimation and renormalization	245
<b>5.7</b>	<b>The Migdal-Kadanoff procedure</b>	248
1	The Ising model on a hypercubic lattice	248
2	General properties of recursion relations	252
3	The Potts lattice gas and krypton on graphite	253
<b>5.8</b>	<b>Momentum shell renormalization group</b>	256
1	Thinning of degrees of freedom and rescaling	256
2	Correlation functions	260
3	The Gaussian model	261
4	The $\epsilon$ -expansion	263
5	$n$ -vector model with cubic anisotropy	267
6	Quadratic anisotropy	269
7	Crossover	270
8	Dangerous irrelevant variables	273
9	The utility of the $\epsilon$ -expansion	275
<b>Appendix 5A</b>	<b>The Hubbard-Stratonovich transformation</b>	276
<b>Appendix 5B</b>	<b>Diagrammatic perturbation theory</b>	277
Bibliography		283
References		283
Problems		283
<b>6</b>	<b>Generalized elasticity</b>	288
<b>6.1</b>	<b>The xy-model</b>	289
1	The elastic free energy	289

2	Boundary conditions and external fields	290
3	The Josephson scaling relation	292
4	Fluctuations	293
5	Long-range order, quasi-long-range order, and disorder	295
6	Resistance of a conducting medium	297
<b>6.2</b>	<b><math>O_n</math> symmetry and nematic liquid crystals</b>	298
1	$n$ -vector elastic energy	298
2	The Frank free energy of nematic liquid crystals	298
3	Cells with non-uniform $\mathbf{n}$	300
4	The Freedericksz transition	302
5	The twisted nematic display	304
6	Fluctuations and light scattering	306
<b>6.3</b>	<b>Smectic liquid crystals</b>	308
1	The elastic free energy	309
2	Fluctuations	312
3	Nonlinearities	314
4	The nematic-to-smectic- <i>A</i> transition	315
<b>6.4</b>	<b>Elasticity of solids: strain and elastic energy</b>	316
1	The strain tensor	316
2	The elastic free energy	318
3	Isotropic and cubic solids	319
4	Fluctuations	321
5	Mercury chain salts – one-dimensional crystals	322
6	Xenon on graphite – a two-dimensional crystal	324
7	Vacancies and interstitials	325
8	Bond-angle order and rotational and translational elasticity	328
9	Elastic constants from density functional theory	329
<b>6.5</b>	<b>Lagrangian elasticity</b>	330
1	Classical theory of elasticity	330
2	Elasticity of classical harmonic lattices	332
<b>6.6</b>	<b>Elasticity of solids: the stress tensor</b>	334
1	The Lagrangian stress tensor	334
2	Stress-strain relations	337
3	The Eulerian stress tensor	338
<b>6.7</b>	<b>The nonlinear sigma model</b>	341
	Bibliography	347
	References	347
	Problems	347
<b>7</b>	<b>Dynamics: correlation and response</b>	353
<b>7.1</b>	<b>Dynamic correlation and response functions</b>	354
1	Correlation functions	354

2 Response functions	355
<b>7.2 The harmonic oscillator</b>	359
1 The undamped oscillator	359
2 The damped oscillator	360
3 The response function	362
4 Dissipation	365
<b>7.3 Elastic waves and phonons</b>	366
1 Sound waves in an elastic continuum	366
2 Acoustic phonons in a harmonic lattice	367
<b>7.4 Diffusion</b>	369
1 Fick's law	369
2 The Green function and dynamic response	370
3 The response function	371
4 External potentials and the Einstein relation	373
5 Brownian motion	375
6 Cooperative diffusion versus self-diffusion	376
7 Master equation for diffusion on a lattice	378
<b>7.5 Langevin theory</b>	381
1 Random forces and thermal equilibrium	381
2 Correlation functions for diffusion	383
3 Short-time behavior	385
4 Fluctuation-dissipation theorem for the harmonic oscillator	387
5 The Fokker-Planck and Smoluchowski equations	388
<b>7.6 Formal properties of response functions</b>	390
1 Response to external fields	390
2 Symmetry properties of response functions	392
3 Dissipation	394
4 Spectral representations of $\chi''_{\phi_i \phi_j}$	395
5 The fluctuation-dissipation theorem	397
6 Sum rules and moment expansions	398
<b>7.7 Inelastic scattering</b>	399
1 Scattering geometry and partial cross-sections	399
2 Fermi golden rule and neutron scattering	400
3 The Fermi pseudopotential	402
4 Coherent and incoherent scattering	404
5 Cross-sections and correlation functions	405
6 Neutron scattering from crystals	406
7 Magnetic scattering	407
8 How neutron scattering experiments are actually done	408
9 Scattering of charged particles and photons	410
<b>Bibliography</b>	411
<b>References</b>	411

Problems	411
<b>8 Hydrodynamics</b>	417
<b>8.1 Conserved and broken-symmetry variables</b>	417
<b>8.2 A tutorial example – rigid rotors on a lattice</b>	419
1 Description of the model	420
2 The disordered phase	421
3 The ordered phase	426
4 Excitations from the classical ground state	430
5 The Goldstone theorem	432
6 Kubo formulae	432
7 Summary	433
<b>8.3 Spin systems</b>	434
1 Spin dynamics	434
2 Generalized Heisenberg models	435
3 The planar magnet	436
4 The isotropic antiferromagnet	438
5 Isotropic ferromagnets	439
<b>8.4 Hydrodynamics of simple fluids</b>	440
1 Conservation laws	441
2 Thermodynamics with mass motion	443
3 The entropy production equation	444
4 Dissipationless hydrodynamics	445
5 Dissipation	446
6 The Navier-Stokes equations	448
7 Hydrodynamic modes	449
8 Light scattering	452
9 Two-component fluids	453
<b>8.5 Liquid crystals, crystalline solids, and superfluid helium</b>	454
1 Nematic liquid crystals	454
2 Smectic- <i>A</i> liquid crystals	456
3 Crystalline solids	459
4 Superfluid helium	460
<b>8.6 Stochastic models and dynamic critical phenomena</b>	464
1 Critical slowing down and the conventional theory	464
2 Dissipative dynamics	466
3 Dynamic scaling	469
4 Poisson bracket terms	472
5 Models with Poisson brackets	475
6 Mode-mode coupling	477
<b>8.7 Nucleation and spinodal decomposition</b>	479
1 Nucleation with a nonconserved order parameter	480
2 Symmetric unstable quench with model A dynamics	483

3	Conserved order parameters and spinodal decomposition	484
	Bibliography	491
	References	491
	Problems	492
9	<i>Topological defects</i>	495
9.1	<b>Characterization of topological defects</b>	495
1	Vortex pairs	499
2	Order parameters with more than two components	499
3	Order parameter spaces and homotopy	501
9.2	<b>Examples of topological defects</b>	506
1	Vortices in $xy$ -models	506
2	Dislocations in smectic liquid crystals	507
3	Periodic solids	512
4	Volterra construction	515
5	Hexagonal and close-packed lattices	515
6	Disclinations in crystals	517
7	Strength of crystals	518
8	Crystal growth	522
9	Grain boundaries	522
10	Nematic and hexatic liquid crystals	524
9.3	<b>Energies of vortices and dislocations</b>	526
1	Simple calculation of $xy$ -vortex energies	526
2	Analogy with magnetism	530
3	Energies of dislocations in crystals	531
4	Dislocations in smectic liquid crystals	536
9.4	<b>Vortex unbinding and the Kosterlitz-Thouless transition</b>	542
1	Vortices and the spin-wave stiffness	542
2	Vortex unbinding in two dimensions – the Kosterlitz-Thouless transition	544
3	Superfluid helium films	551
9.5	<b>Dislocation mediated melting</b>	555
1	Effects of a substrate	558
2	Experiments and numerical simulation	559
9.6	<b>The twist-grain-boundary phase</b>	561
1	Structure of the TGB phase	561
2	The thermodynamic critical field	564
3	The lower critical field	565
4	The upper critical field	566
5	X-ray scattering	568
6	Analogy with superconductivity	571
	<b>Appendix 9A Notes on the Kosterlitz-Thouless transition</b>	573

1	Integration of the KT recursion relations	573
2	Longitudinal and transverse response	575
3	The spin correlation function	577
<b>Appendix 9B</b>	<b>Duality and the Villain model</b>	<b>578</b>
1	Potts models	579
2	The $xy$ -, Villain, and lattice Coulomb-gas models	582
<b>Bibliography</b>		<b>584</b>
<b>References</b>		<b>584</b>
<b>Problems</b>		<b>585</b>
<b>10</b>	<i>Walls, kinks and solitons</i>	<b>590</b>
<b>10.1</b>	<b>Some simple examples</b>	<b>591</b>
<b>10.2</b>	<b>Domain walls in mean-field theory</b>	<b>595</b>
1	The $\phi^4$ kink	597
2	The sine-Gordon soliton	599
3	Dynamics	599
<b>10.3</b>	<b>The Frenkel-Kontorowa model</b>	<b>601</b>
1	Introduction	601
2	Discommensurations	602
3	Devil's staircases and the FK phase diagram	603
4	The continuum approximation	605
5	Nature of solutions	608
6	The minimum energy solution	610
7	Repulsive interaction between discommensurations	613
8	X-ray diffraction	613
9	Compressional elastic constants	614
10	Phasons	615
11	Pinned phasons	617
12	Extension to two dimensions	618
<b>10.4</b>	<b>Fluctuating walls</b>	<b>620</b>
1	Differential geometry and the total surface area	620
2	Curvature	623
3	Energy of a surface	625
4	Fluctuations in the harmonic approximation	626
5	Nonlinearities and renormalization in fluid membranes	629
6	Polymerized membranes	630
<b>10.5</b>	<b>Arrays of fluctuating walls</b>	<b>635</b>
1	Fluctuating walls and steric entropy	635
2	Honeycomb lattice of walls	638
3	Elasticity of sterically stabilized phases	638
4	Dislocations and the CI transition	640
<b>10.6</b>	<b>Roughening and faceting</b>	<b>643</b>
1	The solid-on-solid and discrete Gaussian models	643

2 The roughening transition	646
3 Faceting	648
Bibliography	655
References	656
Problems	656
Glossary	662
Index	685
