Preface	ix		
Preface to first edition	xi		
1 Introduction	1	17 Putative ferns of the Paleozoic	212
2 Plant fossils: preservation, preparation, and age determination	7	18 The emergence of the Marattiales and Ophioglossales	226
3 The fossil record: systematics, reconstruction, and nomenclature	24	19 Filicales of the Carboniferous	238
4 Life in the Precambrian	32	20 The emergence of the modern Filicales, Salviniales, and Marsileales	250
5 Diversification of the fungi	46	21 Free-sporing plants with gymnospermous secondary wood	263
6 Diversification among the algae and related plants	55	22 Gymnosperm reproduction: early evolution	279
7 How the land turned green: speculation	68	23 Paleozoic gymnosperms with fernlike leaves	295
8 How the land turned green: Bryophyta	77	24 Cycads: origins and relationships	338
9 How the land turned green: vascular plants, primitive types	85	25 The enigmatic cycadeoids	350
10 The evolution of microphylls and adaxial sporangia	106	26 More innovation and diversification among gymnosperms	366
11 The isoetalean clade	125	27 The record of a living fossil: Ginkgo	385
12 Paleocology of the Pennsylvanian coal swamps	162	28 The first coniferophytes	393
13 More diversity in the Devonian: the Trimerophytopsida	171	29 The diversification of conifers and taxads	413
14 The origin of the Sphenopsida	180	30 The origin and early evolution of angiosperms	438
15 Unique and extinct: the Upper Paleozoic sphenophylls	190	31 Angiosperms: diversification, radiation, and modernization	468
16 The origin of the horsetails	198	32 Major evolutionary events and trends – in retrospect	505
		Index	513
