Preface	ix
Part I Introduction to systems	1
1 Notations and examples	3
1.1 First order systems	3
1.1.1 Notations	3
1.1.2 Plane waves	4
1.1.3 The symbol	5
1.2 Examples	6
1.2.1 Gas dynamics	6
1.2.2 Maxwell's equations	9
1.2.3 Magneto-hydrodynamics	13
1.2.4 Elasticity	18
2 Constant coefficient systems. Fourier synthesis	21
2.1 The method	21
2.1.1 The Fourier transform	21
2.1.2 Solving the evolution equation (2.1)	23
2.2 Examples	24
2.2.1 The heat equation	24
2.2.2 Schrödinger equation	25
2.2.3 The wave equation	25
2.3 First order systems: hyperbolicity	26
2.3.1 The general formalism	26
2.3.2 Strongly hyperbolic systems	27
2.3.3 Symmetric hyperbolic systems	28
2.3.4 Smoothly diagonalizable systems, hyperbolic systems with constant multiplicities	30

2.3.5	Existence and uniqueness for strongly hyperbolic systems	30
2.4	Higher order systems	31
2.4.1	Systems of Schrödinger equations	31
2.4.2	Elasticity	32
3	The method of symmetrizers	35
3.1	The method	35
3.2	The constant coefficients case	37
3.2.1	Fourier multipliers	37
3.2.2	The first order case	38
3.3	Hyperbolic symmetric systems	39
3.3.1	Assumptions	39
3.3.2	Existence and uniqueness	40
3.3.3	Energy estimates	40
Part II	The para-differential calculus	45
4	Pseudo-differential operators	47
4.1	Fourier analysis of functional spaces	47
4.1.1	Smoothing and approximation	48
4.1.2	The Littlewood-Paley decomposition in H^s	51
4.1.3	The Littlewood-Paley decomposition in Hölder spaces	55
4.2	The general framework of pseudo-differential operators	57
4.2.1	Introduction	57
4.2.2	Operators with symbols in the Schwartz class	57
4.2.3	Pseudo-differential operators of type $(1, 1)$	60
4.2.4	Spectral localization	61
4.3	Action of pseudo-differential operators in Sobolev spaces	62
4.3.1	Stein's theorem for operators of type $(1, 1)$	62
4.3.2	The case of symbols satisfying spectral conditions	65
5	Para-differential operators	67
5.1	Definition of para-differential operators	67
5.1.1	Symbols with limited spatial smoothness	67
5.1.2	Smoothing symbols	68
5.1.3	Operators	72
5.2	Paraproducts	73
5.2.1	Definition	73
5.2.2	Products	74
5.2.3	Para-linearization 1	75

5.2.4	Para-linearization 2	78
6	Symbolic calculus	85
6.1	Composition	85
6.1.1	Statement of the result	85
6.1.2	Proof of the main theorem	86
6.1.3	A quantitative version	91
6.2	Adjoint	92
6.2.1	The main result	92
6.3	Applications	97
6.3.1	Elliptic estimates	97
6.3.2	Gårding's inequality	98
6.4	Pluri-homogeneous calculus	99
Part III	Applications	101
7	Nonlinear hyperbolic systems	103
7.1	The L^2 linear theory	103
7.1.1	Statement of the result	103
7.1.2	Paralinearisation	105
7.1.3	Symmetrizers	106
7.1.4	The basic L^2 estimate	109
7.1.5	Weak= Strong and uniqueness	110
7.1.6	Existence	112
7.2	The H^s linear theory	113
7.2.1	Statement of the result	113
7.2.2	Paralinearisation	114
7.2.3	Estimates	114
7.2.4	Smoothing effect in time	115
7.2.5	Existence	115
7.3	Quasi-linear systems	115
7.3.1	Statement of the results	115
7.3.2	Local in time existence	116
7.3.3	Blow up criterion	119
8	Systems of Schrödinger equations	121
8.1	Introduction	121
8.1.1	Decoupling	122
8.1.2	Further reduction	123
8.2	Energy estimates for linear systems	124
8.2.1	The results	124
8.2.2	Proof of Theorem 8.2.4	125

8.3	Existence, uniqueness and smoothness for linear problems	128
8.3.1	L^2 existence	128
8.3.2	H^s existence	129
8.4	Nonlinear problems	130
8.4.1	Systems with quasilinear first order part	130
8.4.2	Examples and applications	132
