

CONTENTS

Preface	V
From the Author.	IX
Chapter 1. LITHOSPHERE AND ASTHENOSPHERE	1
1.1. Some data on the viscosity of the upper layers of the Earth.	1
1.1.1. Isostatic compensation — concepts of the asthenosphere and lithosphere	1
1.1.2. Diffusion viscosity	3
1.1.3. Viscosity at grain boundaries.	6
1.2. Deformational properties of the crust and mantle beneath Fennoscandia and Canada	7
1.2.1. Effect of distribution of mantle viscosity with depth on form of isostatic movements	7
1.2.2. Post-glacial isostatic uplifts	10
1.2.3. The asthenosphere layer beneath Fennoscandia	13
1.2.4. The relationship between viscosity in the asthenosphere and in the deeper layers of the mantle.	19
1.2.5. The lithosphere layer beneath Fennoscandia	21
1.2.6. The viscosity of the mantle beneath Canada.	23
1.3. Horizontal variations in the properties of the asthenosphere layer.	27
1.3.1. Propagation of elastic waves in the region of the asthenosphere	28
1.3.2. Temperature of the mantle in areas of distribution of the low-velocity layer.	31
1.3.3. Horizontal variations of viscosity in the asthenosphere.	35
1.4. Thickness of the lithosphere	36
1.4.1. Thickness of the lithosphere in platformal areas	36
1.4.2. Thickness of the lithosphere in oceanic areas	39
1.4.3. Thickness of the lithosphere in tectonically active regions.	42
1.5. Viscosity of the lithosphere.	48
1.5.1. Viscosity of the lithosphere in stable areas on the continents with respect to horizontal and vertical deformations.	48
1.5.2. Viscosity of the oceanic parts of the lithosphere plates.	52
Chapter 2. ESTABLISHMENT OF ISOSTATIC EQUILIBRIUM.	55
2.1. The equation of isostatic movements	55
2.2. Computations of post-glacial uplifts, associated with transport of material in the asthenosphere	60
2.2.1. The uplift of Fennoscandia.	60
2.2.2. The uplift of Canada	65
2.3. Velocity of restoration of isostasy and location of anomalous masses that create isostatic anomalies	68
2.3.1. Relations between velocity of isostatic movements and dimensions of the area of uncompensated load.	68
2.3.2. Location of major density variations in the crust and mantle.	71
2.4. Glacio-isostatic movements in periglacial areas and their consequences.	75

XIV

2.4.1. Crustal deformations during advance and retreat of ice sheets and the origin of periglacial deposits	75
2.4.2. Location of Quaternary periglacial water areas in the west of the Russian Plain	77
2.4.3. Quaternary glaciations and transgressions in Siberia and in the north of the Russian Plain	78
Chapter 3. ORIGIN AND FORM OF MOVEMENTS IN THE DEEP INTERIOR OF THE EARTH.	83
3.1. Modern hypotheses on crustal movements and their mechanisms	83
3.1.1. Horizontal movements.	83
3.1.2. Vertical movements.	89
3.2. Density differentiation at the core—mantle interface	92
3.2.1. Formation of the core as a result of density differentiation in the primary material of the Earth	92
3.2.2. Fundamental properties of the Earth's core	93
3.2.3. Melting of core material in the lower mantle and density differentiation at the core—mantle interface	94
3.3. Convection in the lower mantle	100
3.3.1. Redistribution of material in the Earth's interior and the evolution of its construction	100
3.3.2. Release of energy in the outer core and the origin of the geomagnetic field	103
3.3.3. Release of energy in the upper mantle.	104
3.3.4. Effects of density distribution in the lower mantle on the form of the convection currents.	105
3.3.5. The rise of light material along conduits in a non-uniform lower mantle	107
3.3.6. Form of movements in the lower mantle based on geotectonic and seismological data	111
3.3.7. Some other patterns of chemical convection	113
3.3.8. Movement of light material along the core—mantle interface	114
3.4. Convection in the upper mantle and heterogeneities in its construction	117
3.4.1. Differentiation of light material in the upper mantle	117
3.4.2. Uplift of light material in the upper mantle and heterogeneities in the asthenosphere	118
3.4.3. Movements in the asthenosphere, arising through differentiation	122
3.4.4. The role of heat convection	124
3.4.5. Development of convection through time	127
Chapter 4. THE NATURE OF VERTICAL CRUSTAL MOVEMENTS.	131
4.1. Interaction between light material and variations in the thickness of the lithosphere.	131
4.1.1. Anomalous mantle in the upper layers of the Earth	131
4.1.2. Movement of light material along the base of the lithosphere.	132
4.1.3. Evolution of variations in thickness in the lithosphere and interaction of the flow of light material with them	139
4.2. Ascending movements	140
4.2.1. The shields of the platforms	140
4.2.2. Regions of tectonic activation	142
4.2.3. Mountain complexes of the Alpine geosynclinal belt of Eurasia	147
4.2.4. Island arcs	151
4.2.5. The mid-ocean ridges.	152
4.3. Sedimentary basins in platformal regions	154

4.3.1. Density changes in the crust and mantle during the formation of a sedimentary basin on the site of a crystalline shield	154
4.3.2. Depth of the sedimentary basin	156
4.3.3. Subsidence of the crust during compression of the mantle in a trap beneath the shield	158
4.3.4. Subsidence during compression in the basaltic layer of the crust	159
4.4. Internal seas and passive margins of the oceans	162
4.4.1. Disintegration of the basaltic layer beneath sedimentary basins on the platforms during contact with anomalous mantle	162
4.4.2. Formation of internal seas as a result of eciogitization of the basaltic layer	166
4.4.3. Subsidence of the crust on the passive ocean margins	171
4.5. Inheritance of vertical movements and isostatic compensation	174
4.5.1. Nature of the inherited character of vertical crustal movements	174
4.5.2. Arrangement of anomalous masses that compensate for relief	176
 Chapter 5. THE NATURE OF MAJOR STRESSES IN THE LITHOSPHERE AND ITS EQUILIBRIUM POSITION	 179
5.1. Stresses resulting from variations in the thickness of the crust and the layer of anomalous mantle	179
5.1.1. Major stresses in the lithosphere as a motive force for tectonic movements	179
5.1.2. The physical nature of the stresses associated with variations in the thickness of the crust and the anomalous mantle	180
5.1.3. Stresses in a layer of variable thickness and constant density, floating in an inviscid liquid	183
5.1.4. Stresses in the lithosphere, floating on the asthenosphere	187
5.2. Convection in the mantle and gravity sliding	191
5.2.1. Viscous friction between lithosphere and asthenosphere	191
5.2.2. Gravity sliding	193
5.3. Subsidence of plates of oceanic lithosphere into the mantle	196
5.3.1. Subsidence of a plate into anomalous mantle	196
5.3.2. Interaction between a subsiding plate and the surrounding mantle . . .	201
5.3.3. The cause of inclined subsidence of the plates	204
5.3.4. Tractional force developed by subsiding plates	209
5.4. Deviations of the crust from isostasy	211
5.4.1. Physical nature of disturbances to isostasy	211
5.4.2. Equilibrium of a viscous layer, floating on an inviscid liquid	214
5.4.3. Equilibrium of a lithosphere layer with constant viscosity	219
Appendix — The equilibrium position of the Earth's lithosphere	223
 Chapter 6. THE ORIGIN OF HORIZONTAL MOVEMENTS OF THE LITHOSPHERE AND INTENSE EARTHQUAKES	 233
6.1. Major horizontal movements of lithosphere plates	233
6.1.1. The force, operating in the oceanic lithosphere	233
6.1.2. Ocean-floor spreading and continental drift	239
6.1.3. Earthquakes on active margins	244
6.1.4. Origin of the force, acting on an oceanic basin from the direction of the mid-ocean ridges	246
6.2. Stresses, deformations, and earthquakes in continental regions	249
6.2.1. Continental platforms	249
6.2.2. Uplifts, characterized by tensional stresses	251
6.2.3. Rifting	257

XVI

6.2.4. The formation of marginal seas	259
6.2.5. Regions of compression of the lithosphere	263
6.3. Relations between vertical and horizontal movements	269
6.3.1. Validity of introducing the 'lithosphere plate' concept.	269
6.3.2. The formation of mountain complexes and compressional deformation of the lithosphere	270
6.3.3. Compression of the lithosphere and subduction of continental litho- sphere plates	273
Chapter 7. CONCLUSIONS — A GLOBAL SCHEME OF TECTONISM	279
7.1. Movements in the Earth's mantle	279
7.2. Vertical movements of the lithosphere.	282
7.3. Horizontal movements of the lithosphere.	284
