

Contents

1	Introduction and theoretical concepts	1
1.1	Strata-bound appearance	1
1.2	Geosynclinal magmatism	1
1.3	Local massive ore deposition in „Lagern“, lenses, „Schoten“ and similar forms	2
1.4	Origin of the ores from submarine thermal activity	2
1.5	Comprehensive concordant ore deposits within country rocks	2
1.6	Pre-tectonic age of the pyrite deposits and from this resulting continuously tectonic and metamorphic influences	3
1.7	Mobilization and recrystallization during diagenesis and regional metamorphism	3
2	Megascopically visible texture, supported by microscopic studies	3
2.1	Normal parallel texture	3
2.2	Relationship between bedding and cleavage	4
2.3	Boudinage → nodules → „Druckschattenbildung“ (pressure shadows)	4
3	Micro-texture	4
3.1	„Härtlinge“	4
3.2	„Kristalloblasten“-contents	5
3.3	Gel-formations	5
3.3.1	Decomposition and crystallization of ore-gels	6
3.3.2	Gel-textures in pyrite ore	7
3.3.3	Pyrite spheroids	8

4	Post-sedimentary procedures	9
4.1	„Sammelkristallisation“ and „self-purification“	9
4.2	Cataclasis, corrosion and alteration sensu strictu	9
4.3	The problem pyrite-pyrrhotite	10
4.4	Solid solution and exsolution	12
4.5	Formation of silicate minerals during progressive regional metamorphism	13
5	Classic secondary formations	13
5.1	Decomposition of pyrrhotite	13
6	Abstract	14
7	Literature	15
