<i>List of figures</i>	viii
<i>List of tables</i>	ix
<i>Introduction</i>	xi
 PART I CONTROLLING POLLUTION BY ADJUSTING THE COMBINATION OF GOODS PRODUCED	
1 Production function of the firm	3
2 Pollution damage to households	24
3 Pollution damage to firms	38
4 Non-convexity and large polluting firms	51
5 Stochastic pollution damage	61
6 The scale of the polluting firm	71
 PART II CONTROLLING POLLUTION BY PREVENTING OR ABATING EMISSIONS AND BY ADJUSTING THE COMBINATION OF GOODS PRODUCED	
7 Pollution prevention	89
8 Recycling pollutive output	102
9 End-of-pipe abatement	112
10 Subsidizing abatement	122
11 Transactions costs of pollution control	137
 PART III CONTROLLING POLLUTION BY AVOIDING EXPOSURE, BY PREVENTING OR ABATING EMISSIONS, AND BY ADJUSTING THE COMBINATION OF GOODS PRODUCED	
12 Exposure avoidance by receptor firms	151
13 The quadruple equality	171
14 Abatement versus avoidance	186
15 The total cost of pollution	205

Figures

1.1	Labour-dominant technology	13
1.2	Capital-dominant technology	14
1.3	Dominance reversal	15
2.1	The statistical value of a human life	28
2.2	Decreasing marginal pollution damage	33
2.3	Construction of a Scitovsky community indifference curve	35
4.1	Concave and convex-concave production possibility frontiers	53
4.2	Non-convex production possibility frontier	55
6.1	Stolper–Samuelson adjustment when a good is taxed	73
6.2	Average cost curves when emissions decline with output	76
6.3	Identical polluting firms in their well-mixed cells	82
7.1	Production possibility frontier in linear activity analysis	92
7.2	Production possibility frontier generated first by substituting a clean for a toxic input and then by using a pollution-free process	97
11.1	<i>Laissez-faire</i> allocation with zero transactions costs, distortionary funding of transactions costs and Pigouvian funding of transactions costs	146
12.1	The expected marginal revenue product of the avoidance input	162
12.2	The expected marginal revenue product of direct labour when more of the avoidance input is employed	167
14.1	The case of weak interaction	189
14.2	The case of strong interaction	190
15.1	Marginal curves in <i>laissez-faire</i> equilibrium	216
15.2	Marginal curves in the Pareto optimum	217
15.3	General Pigouvian equilibrium with marginal cost and damage curves	220
15.4	The case of the downward-sloping marginal pollution damage curve	226

Tables

1.1	Efficient allocations of inputs with three classes of production functions	8
1.2	The computer program	18
2.1	Sequence of tax rates in a Pigouvian algorithm	29
3.1	<i>Laissez-faire</i> , low-tax and Pigouvian solutions of the numerical example	45
3.2	<i>Laissez-faire</i> and the Pareto-optimal competitive equilibria in the numerical example of reciprocal and reflexive pollution damage	49
4.1	<i>Laissez-faire</i> and Pigouvian allocations along the non-convex production possibility frontier when the community utility function is $[x^{0.9} + (7.566163)y^{0.9}]$	56
5.1	<i>Laissez-faire</i> and Pigouvian equilibria when consumers are risk-neutral and when they are risk-averse	69
6.1	Simulation models in which the emission rate varies with the output of the polluting firm	77
6.2	Optimal solutions of the Carlton and Loury model	84
7.1	<i>Laissez-faire</i> and Pigouvian allocations along the frontier generated by two substitutable processes	98
8.1	<i>Laissez-faire</i> and Pigouvian equilibrium of the recycling economy	107
9.1	Optimal solutions of the Harford model	119
10.1	Pigouvian tax versus subsidy	126
10.2	<i>Laissez-faire</i> and Pigouvian allocations when households as well as firms pollute	134
11.1	Transactions costs of Pigouvian taxation	142
11.2	Transactions funding and the double dividend	144
12.1	Numerical example of efficient avoidance by receptor firms	157
12.2	Expected profit-maximizing solutions for the risk-neutral and risk-averse firms	165
12.3	Input and output possibilities for the risk-averse firm relative to the risk-neutral firm	168
13.1	Sequence of Pigouvian taxes	177
13.2	Alternative Pigouvian tax rates when the pollutant concentration is uncertain and exposure-avoiding receptors are risk-averse	182
14.1	A misleading sequence of Pigouvian signals	191

14.2	The Pigouvian algorithm in the numerical example of indoor and outdoor pollution	202
15.1	Simulating the taxation of expected spilled oil	215
15.2	Optimal solutions with low, medium and high pollution damage	225
