Foreword by Arthur L. Loeb	ix
Preface	xi
Introduction: Basic properties of the sphere	1
I. The regular spherical models	
The spherical hexahedron or cube	4
General instructions for making models	7
The spherical octahedron	7
The spherical tetrahedron	9
The spherical icosahedron and dodecahedron	12
The polyhedral kaleidoscope	16
Summary	18
II. The semiregular spherical models	
The spherical cuboctahedron	24
The spherical icosidodecahedron	24
Spherical triangles as characteristic triangles	28
The five truncated regular spherical models	34
The rhombic spherical models	39
The rhombitruncated spherical models	44
The snub forms as spherical models	48
The spherical duals	51
Summary	54
III. Variations	
Regular and semiregular variations	55
Star-faced spherical models	58

IV. Geodesic domes

The simplest geodesic domes	80
Geodesic domes derived from the icosahedron	82
General instructions for making geodesic models	92
An alternative method of approaching geodesic segmentation	92
Introduction to geodesic symbolism and classification	98
Geodesic models derived from the dodecahedron	100
An alternative for geodesic segmentation of the dodecahedron	108
A second alternative for geodesic segmentation of the icosahedron	110
An alternative for geodesic segmentation of the snub dodecahedron	114
A third alternative for geodesic segmentation of the icosahedron	120
Final comments	122

V. Miscellaneous models

Honeycomb models, edge models, and nolds	125
An introduction to the notion of polyhedral density	132
Edge models of stellated forms	135
Some final comments about geodesic domes	137
Epilogue	144
References	145
List of models	147
