|---------------------------------------------------------------------------------------|------------|
| <b>Introduction</b>                                                                   | <b>1</b>   |
| <b>Chapter 1 Linear extension and Moore spaces</b>                                    | <b>8</b>   |
| 1.1 Detecting functors, linear extensions, and the cohomology of categories           | 8          |
| 1.2 Whitehead's quadratic functor $\Gamma$                                            | 15         |
| 1.3 Moore spaces and homotopy groups with coefficients                                | 18         |
| 1.4 Suspended pseudo-projective planes                                                | 21         |
| 1.5 The homotopy category of Moore spaces $\mathbf{M}^n$ , $n \geq 3$                 | 23         |
| 1.6 Moore spaces and the category $\mathbf{G}$                                        | 25         |
| <b>Chapter 2 Invariants of homotopy types</b>                                         | <b>31</b>  |
| 2.1 The Hurewicz homomorphism and Whitehead's certain exact sequence                  | 32         |
| 2.2 $\Gamma$ -groups with coefficients                                                | 40         |
| 2.3 An exact sequence for the Hurewicz homomorphism with coefficients                 | 45         |
| 2.4 Infinite symmetric products and Kan loop groups                                   | 51         |
| 2.5 Postnikov invariants of a homotopy type                                           | 54         |
| 2.6 Boundary invariants of a homotopy type                                            | 63         |
| 2.7 Homotopy decomposition and homology decomposition                                 | 72         |
| 2.8 Unitary invariants of a homotopy type                                             | 76         |
| <b>Chapter 3 On the classification of homotopy types</b>                              | <b>81</b>  |
| 3.1 kype functors                                                                     | 81         |
| 3.2 bype functors                                                                     | 85         |
| 3.3 Duality of bype and kype                                                          | 89         |
| 3.4 The classification theorem                                                        | 97         |
| 3.5 The semitrivial case of the classification theorem and Whitehead's classification | 104        |
| 3.6 The split case of the classification theorem                                      | 107        |
| 3.7 Proof of the classification theorem                                               | 111        |
| <b>Chapter 4 The CW-tower of categories</b>                                           | <b>116</b> |
| 4.1 Exact sequences for functors                                                      | 117        |
| 4.2 Homotopy systems of order $(n + 1)$                                               | 121        |

|     |                                                    |     |
|-----|----------------------------------------------------|-----|
| 4.3 | The CW-tower of categories                         | 124 |
| 4.4 | Boundary invariants for homotopy systems           | 129 |
| 4.5 | Three formulas for the obstruction operator        | 131 |
| 4.6 | $\lambda$ -Realizability                           | 135 |
| 4.7 | Proof of the boundary classification theorem       | 138 |
| 4.8 | The computation of isotropy groups in the CW-tower | 143 |

## **Chapter 5 Spanier–Whitehead duality and the stable CW-tower 149**

|     |                                           |     |
|-----|-------------------------------------------|-----|
| 5.1 | Cohomotopy groups                         | 149 |
| 5.2 | Spanier–Whitehead duality                 | 152 |
| 5.3 | Cohomology operations and homotopy groups | 156 |
| 5.4 | The stable CW-tower and its dual          | 163 |

## **Chapter 6 Eilenberg–Mac Lane and Moore functors 168**

### **A Eilenberg–Mac Lane functors 168**

|     |                                                                                                       |     |
|-----|-------------------------------------------------------------------------------------------------------|-----|
| 6.1 | Homology of Eilenberg–Mac Lane spaces                                                                 | 168 |
| 6.2 | Some functors for abelian groups                                                                      | 170 |
| 6.3 | Examples of Eilenberg–Mac Lane functors                                                               | 178 |
| 6.4 | On $(m - 1)$ -connected $(n + 1)$ -dimensional homotopy types with $\pi_i X = 0$ for $m < i < n$      | 181 |
| 6.5 | Split Eilenberg–Mac Lane functors                                                                     | 184 |
| 6.6 | A transformation from homotopy groups of Moore spaces to homology groups of Eilenberg–Mac Lane spaces | 186 |

### **B Moore functors 190**

|      |                                                                                                    |     |
|------|----------------------------------------------------------------------------------------------------|-----|
| 6.7  | Moore types and Moore functors                                                                     | 191 |
| 6.8  | On $(m - 1)$ -connected $(n + 1)$ -dimensional homotopy types $X$ with $H_i X = 0$ for $m < i < n$ | 195 |
| 6.9  | The stable case with trivial 2-torsion                                                             | 196 |
| 6.10 | Moore spaces and Spanier–Whitehead duality                                                         | 198 |
| 6.11 | Homotopy groups of Moore spaces in the stable range                                                | 202 |
| 6.12 | Stable and principal maps between Moore spaces                                                     | 206 |
| 6.13 | Quadratic $\mathbb{Z}$ -modules                                                                    | 215 |
| 6.14 | Quadratic derived functors                                                                         | 225 |
| 6.15 | Metastable homotopy groups of Moore spaces                                                         | 229 |

## **Chapter 7 The homotopy category of $(n - 1)$ -connected $(n + 1)$ -types 239**

|     |                                                                            |     |
|-----|----------------------------------------------------------------------------|-----|
| 7.1 | A linear extension for <b>types</b> <sub><math>n</math></sub> <sup>1</sup> | 240 |
| 7.2 | The enriched category of Moore spaces                                      | 244 |

|                   |                                                                                                                                           |            |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------|------------|
| <b>Chapter 8</b>  | <b>On the homotopy classification of <math>(n - 1)</math>-connected <math>(n + 3)</math>-dimensional polyhedra, <math>n \geq 4</math></b> | <b>249</b> |
| 8.1               | Algebraic models of $(n - 1)$ -connected $(n + 3)$ -dimensional homotopy types, $n \geq 4$                                                | 249        |
| 8.2               | On $\pi_{n+2}M(A, n)$                                                                                                                     | 258        |
| 8.3               | The group $\Gamma_{n+2}$ of an $(n - 1)$ -connected space, $n \geq 4$                                                                     | 263        |
| 8.4               | Proof of the classification theorem 8.1.6                                                                                                 | 267        |
| 8.5               | Adem operations                                                                                                                           | 269        |
| <b>Chapter 9</b>  | <b>On the homotopy classification of 2-connected 6-dimensional polyhedra</b>                                                              | <b>277</b> |
| 9.1               | Algebraic models of 2-connected 6-dimensional homotopy types                                                                              | 277        |
| 9.2               | On $\pi_5M(A, 3)$                                                                                                                         | 286        |
| 9.3               | Whitehead's group $\Gamma_5$ of a 2-connected space                                                                                       | 291        |
| <b>Chapter 10</b> | <b>Decomposition of homotopy types</b>                                                                                                    | <b>294</b> |
| 10.1              | The decomposition problem in representation theory and topology                                                                           | 294        |
| 10.2              | The indecomposable $(n - 1)$ -connected $(n + 3)$ -dimensional polyhedra, $n \geq 4$                                                      | 298        |
| 10.3              | The $(n - 1)$ -connected $(n + 3)$ -dimensional polyhedra with cyclic homology groups, $n \geq 4$                                         | 314        |
| 10.4              | The decomposition problem for stable types                                                                                                | 316        |
| 10.5              | The $(n - 1)$ -connected $(n + 2)$ -types with cyclic homotopy groups, $n \geq 4$                                                         | 320        |
| 10.6              | Example: the truncated real projective spaces $\mathbb{R}P_{n+4}/\mathbb{R}P_n$                                                           | 327        |
| 10.7              | The stable equivalence classes of 4-dimensional polyhedra and simply connected 5-dimensional polyhedra                                    | 330        |
| <b>Chapter 11</b> | <b>Homotopy groups in dimension 4</b>                                                                                                     | <b>333</b> |
| 11.1              | On $\pi_4M(A, 2)$                                                                                                                         | 333        |
| 11.2              | On $\pi_3(A, M(B, 2))$                                                                                                                    | 344        |
| 11.3              | On $\Gamma_4X$ and $\Gamma_3(B, X)$                                                                                                       | 347        |
| 11.3A             | Appendix: nilization of $\Gamma_4X$                                                                                                       | 354        |
| 11.4              | On $H_3(B, K(A, 2))$ and difference homomorphisms                                                                                         | 356        |
| 11.5              | Elementary homotopy groups in dimension 4                                                                                                 | 361        |
| 11.6              | The suspension of elementary homotopy groups in dimension 4                                                                               | 382        |
| <b>Chapter 12</b> | <b>On the homotopy classification of simply connected 5-dimensional polyhedra</b>                                                         | <b>385</b> |
