List of symbols	IX
Abstract	XIV
1 Introduction	1
1.1 Advanced materials and active systems	1
1.2 A brief word on modeling in engineering	3
1.3 Review of past work	4
1.4 Objectives and layout of the present work	6
2 Modeling of composite laminates	8
2.1 The constituents of composite materials.....	8
2.2 Laminate architecture of composite materials.....	10
2.3 Elastic behavior of composite materials.....	12
2.3.1 Stress, strain and stress-strain relations	13
2.3.2 Forms of material constitutive (stiffness or compliance) matrix.....	16
2.3.3 In-plane rotation of reference system	18
2.4 Structures made of composite laminates	20
2.4.1 Assumptions of equivalent single-layer 2D-theories.....	22
2.4.2 Strain field in the FSDT	25
2.4.3 Stress field	28
2.4.4 Laminate constitutive equation	30
2.5 Summary.....	33

3	Multi-functional materials – piezoelectricity	35
3.1	Multi-functional materials	35
3.2	Piezoelectricity	39
3.2.1	Short history of piezoelectricity.....	39
3.2.2	Piezoelectric effect and materials	40
3.2.3	Piezoelectric effect in ferroelectrics – hysteresis.....	41
3.2.4	Constitutive equations of linear theory of piezoelectricity.....	45
3.2.5	Piezoelectric patch polarized in thickness direction	47
3.3	Summary.....	52
4	Finite element formulation	54
4.1	Displacement-based finite element method.....	55
4.2	Variational principle for piezoelectric continuum.....	58
4.3	Finite element discretized equations	60
4.4	Nonlinear analysis	63
4.4.1	Geometrically nonlinear analysis	64
4.4.2	Updated Lagrangian and co-rotational formulation	64
4.4.3	Finite element equation in geometrically nonlinear analysis	67
4.5	Summary.....	70
5	Shell element for active structures	72
5.1	A short review of finite element approaches to shell modeling	72
5.2	Degenerated shell element	73
5.3	9-node full biquadratic degenerated shell element for smart structures.....	75
5.3.1	Element geometry and shape functions	75
5.3.2	Displacement field.....	80

5.3.3	Strain displacement matrix	83
5.3.4	Element mechanical stiffness matrix	87
5.3.4.1	Mechanical stiffness matrix for linear analysis due to mechanical properties of the material	88
5.3.4.2	Torsional stiffness	90
5.3.4.3	Mechanical stiffness matrix for linear analysis due to piezoelectric properties of active layers	92
5.3.4.4	Geometrical (initial stress) stiffness matrix	94
5.3.5	Element piezoelectric coupling matrix	95
5.3.6	Element dielectric stiffness matrix	96
5.3.7	Element mass matrix	96
5.3.8	Element load vector	98
5.3.9	Internal forces	102
5.3.10	Internal electric charges	103
5.4	Numerical integration and its order	103
5.5	Summary	104

6	Numerical examples	106
6.1	Influence of the electric field modeling on the accuracy of the piezoelectric structure's response prediction	107
6.1.1	Piezoelectric bimorph beam	109
6.1.2	Active beam structure	114
6.1.3	Active plate structure	116
6.1.4	Modal analysis of active plate structure	117
6.2	Fiber-reinforced active composite laminates	120
6.2.1	Shape control of active composite plate	121
6.2.2	Cantilevered cylindrical composite shell with piezolayers	123

6.2.3	Simply supported composite cylindrical arch with piezolayers	129
6.2.4	Simply supported composite spherical shell with piezolayers	132
6.3	Nonlinear and transient analysis.....	135
6.3.1	Static nonlinear analysis, different boundary conditions	136
6.3.2	Transient analysis of active beam structure	147
6.3.3	Dynamic analysis of a plate by means of sensors	149
6.3.4	Geometrically nonlinear transient analysis.....	152
6.4	Summary.....	154
7	Conclusions and outlook	157
A	Improved transverse shear stiffness for composite laminates	160
B	Displacement derivatives of the ACSHELL9 element within the local coordinate system	162
C	Explicit time integration and dynamic relaxation method	164
