

CONTENTS

1	Autonomous Differential Equations of the Second Order	
1.1	Introduction	1
1.2	Existence, uniqueness and continuity theorems for the first-order system $dx/dt = P(x, y)$, $dy/dt = Q(x, y)$	2
1.3	Discussion of the method of iteration	7
1.4	Applications of the method of iteration	11
1.5	Method of isoclines	19
1.6	Variation of the initial conditions	19
2	Singular Points	
2.1	Introduction	21
2.2	Integral curves in the neighbourhood of a singular point	22
2.3	The case $ad - bc = 0$, a, b, c, d nonzero	28
2.4	The case $a = b = c = d = 0$	32
2.5	Special case $a = b = c = d = 0$, leading terms quadratic in x and y	39
2.6	The concept of index in two dimensions and its application to autonomous systems	40
2.7	The distribution of singular points for first-order differential equations	42
2.8	The index of the equator	46
3	Cycles without Contact and Limit Cycles	
3.1	Introduction	54
3.2	The theory of contacts, arcs without contact, and cycles without contact	54
3.3	The totality of integral curves in the (x, y) -plane	58
3.4	Cycles without contact and limit cycles	65
3.5	Examples of complete discussions	67
3.6	The resolution of limit cycles	72
3.7	Stability of limit cycles	83
3.8	Theory of bifurcation	88
3.9	The infinitesimal transformation and its relevance in the search for limit cycles	92

4	Special Investigations of Liénard and LaSalle	
4.1	Introduction	96
4.2	Liénard's investigation	97
4.3	LaSalle's investigation	106
4.4	Higher approximations for the equation of the limit cycle and the periodic time	112
5	The Small-Parameter Method of Poincaré and its Extension	
5.1	The small-parameter method of Poincaré	118
5.2	Application of the method to particular equations	123
5.3	Method of Van der Pol	135
5.4	The extension by Lighthill of the Poincaré small-parameter method	139
5.5	Temple's method of regularisation	148
6	Differential Equations in which a Small Parameter Is Associated as a Factor with the Differential Coefficient of the Highest Order	
6.1	Introduction	152
6.2	Application of the "coordinate stretching" technique to a linear differential equation with constant coefficients	152
6.3	Application of the "coordinate stretching" technique to a hydrodynamical problem	155
6.4	The investigation by Carrier and Lewis of the Van der Pol equation when the parameter is large	159
6.5	Dorodnicyn's investigation of the Van der Pol equation	167
7	Theory of Centres and its Application by Bautin in a Limit Cycle Investigation	
7.1	Introduction	179
7.2	Centres in the case of differential equations of the second degree	183
7.3	Bautin's investigation of the differential equation $dy/dx = Q/P$ where P and Q are second-degree polynomials in x and y	193
8	Stability Theory and the Use of Liapunov Functions	
8.1	Introduction and definitions	212
8.2	Liapunov stability theorems	214
8.3	Liapunov instability theorems	218
8.4	Stability using the linear approximation	220

8.5	Linear differential equations with real constant coefficients . . .	222
8.6	Nonlinear systems	231
8.7	General theory of linear systems with a nonlinear control . . .	235
8.8	The Liapunov method and the determination of limit cycles in two dimensions	241
8.9	Examples	246
9	Differential Equations of the Second Order with a Forcing Term	
9.1	Introduction	250
9.2	Boundedness of solutions	250
9.3	Existence of periodic solutions	251
9.4	Van der Pol's equation with a forcing term	260
	Index	273
