

CONTENTS

1. Presentation of the models	1
1.1. Fundamental equations for newtonian fluids	1
1.2. Approximated and simplified models	9

Part I: Incompressible Models

2. Density-dependent Navier–Stokes equations	19
2.1. Existence results	19
2.2. Regularity results and open problems	31
2.3. A priori estimates and compactness results	35
2.4. Existence proofs	64
2.5. Uniqueness: weak = strong	75
3. Navier–Stokes equations	79
3.1. A brief review of known results	79
3.2. Refined regularity of weak solutions via Hardy spaces	92
3.3. Second derivative estimates	98
3.4. Temperature and the Rayleigh–Benard equations	110
4. Euler equations and other incompressible models	124
4.1. A brief review of known results	125
4.2. Remarks on Euler equations in two dimensions	136
4.3. Estimates in three dimensions?	150
4.4. Dissipative solutions	153
4.5. Density-dependent Euler equations	158
4.6. Hydrostatic approximations	160
Appendix A. Truncation of divergence-free vector fields in Sobolev spaces	165
Appendix B. Two facts on $\tilde{\mathcal{D}}^{1,2}(\mathbb{R}^2)$	173
Appendix C. Compactness in time with values in weak topologies	177

Appendix D. Weak L^1 estimates for solutions of the heat equation	178
Appendix E. A short proof of the existence and uniqueness of renormalized solutions for parabolic equations	183
Bibliography of Volumes 1 and 2	196
Index	233
