|---------------------------------------------------------------------------|------|
| <b>Preface</b> .....                                                      | xiii |
| <b>1 Wavelets: Basic properties, parameterizations and sampling</b> ..... | 1    |
| 1.1 Scaling and multiresolution analysis .....                            | 2    |
| 1.1.1 Orthonormal wavelet bases for $L^2(\mathbb{R})$ .....               | 6    |
| 1.1.2 Subband coding and FWT .....                                        | 7    |
| 1.1.3 Biorthogonal multiresolution analyses .....                         | 13   |
| 1.1.4 Regularity for scaling distributions .....                          | 15   |
| 1.2 A construction of quadrature mirror filters .....                     | 23   |
| 1.2.1 The Zak transform .....                                             | 24   |
| 1.2.2 Scaling functions in the Zak domain .....                           | 25   |
| 1.2.3 QMF construction algorithm .....                                    | 27   |
| 1.2.4 Constraints on samples imposed by QMFs .....                        | 28   |
| 1.2.5 Parameterization of four-coefficient systems .....                  | 28   |
| 1.2.6 Cardinal scaling functions .....                                    | 29   |
| 1.3 Computing the scaling function .....                                  | 30   |
| 1.4 Notes .....                                                           | 31   |
| <b>2 Derivatives and multiwavelets</b> .....                              | 41   |
| 2.1 Wavelets and derivatives .....                                        | 42   |
| 2.1.1 Nonstandard wavelet representation of $d/dx$ .....                  | 42   |
| 2.1.2 Differentiation and commutation of MRAs .....                       | 44   |
| 2.1.3 Wavelet characterization of Sobolev norms .....                     | 45   |
| 2.1.4 Sobolev estimates for pointwise products .....                      | 49   |
| 2.2 Piecewise polynomial multiwavelets .....                              | 53   |
| 2.2.1 Multiwavelet introduction .....                                     | 53   |
| 2.2.2 Alpert's piecewise polynomial wavelets .....                        | 54   |
| 2.2.3 Interpolating scaling functions .....                               | 54   |
| 2.2.4 Multiscaling properties .....                                       | 55   |
| 2.3 Multiwavelets based on fractal interpolation vectors .....            | 58   |

|          |                                                               |            |
|----------|---------------------------------------------------------------|------------|
| 2.3.1    | Fractal interpolation functions .....                         | 58         |
| 2.3.2    | DGHM multiwavelets .....                                      | 59         |
| 2.3.3    | Multiwavelets and Sobolev spaces on $\mathbb{R}_+$ .....      | 61         |
| 2.3.4    | Strela's two-scale transform and commutation .....            | 63         |
| 2.3.5    | Smoothing and roughening DGHM scaling filters .....           | 67         |
| 2.3.6    | Biorthogonal multiwavelets on $H_0^1(\mathbb{R}_+)$ .....     | 70         |
| 2.4      | Notes .....                                                   | 75         |
| <b>3</b> | <b>Sampling in Fourier and wavelet analysis .....</b>         | <b>89</b>  |
| 3.1      | Frames .....                                                  | 91         |
| 3.1.1    | The frame algorithm .....                                     | 92         |
| 3.1.2    | Frame acceleration .....                                      | 94         |
| 3.2      | Sampling of trigonometric functions .....                     | 101        |
| 3.2.1    | Uniform sampling and the fast Fourier transform .....         | 101        |
| 3.2.2    | Nonuniform (fast) Fourier transforms .....                    | 102        |
| 3.2.3    | Algorithms based on Taylor polynomials .....                  | 103        |
| 3.2.4    | The Dutt–Rokhlin algorithm .....                              | 105        |
| 3.2.5    | The inverse transforms .....                                  | 107        |
| 3.2.6    | Nonuniform sampling and frames .....                          | 108        |
| 3.3      | Sampling in the Paley–Wiener spaces .....                     | 110        |
| 3.3.1    | Sampling sets for the Paley–Wiener spaces .....               | 112        |
| 3.3.2    | Iterative reconstructions in $PW_\Omega$ .....                | 114        |
| 3.3.3    | Prolate spheroidal wavefunctions .....                        | 115        |
| 3.3.4    | The $\Omega T$ theorem .....                                  | 118        |
| 3.3.5    | Quadrature for Paley–Wiener spaces .....                      | 120        |
| 3.4      | Sampling in phase space: the short-time Fourier transform ... | 131        |
| 3.4.1    | Regular Gabor frames .....                                    | 133        |
| 3.4.2    | Irregular Gabor frames .....                                  | 138        |
| 3.5      | Sampling in principal shift-invariant spaces .....            | 144        |
| 3.5.1    | Iterative reconstruction in PSI spaces .....                  | 145        |
| 3.5.2    | Periodic nonuniform sampling in PSI spaces .....              | 147        |
| 3.6      | Notes .....                                                   | 157        |
| <b>4</b> | <b>Bases for time–frequency analysis .....</b>                | <b>163</b> |
| 4.1      | Wilson bases and the Zak transform .....                      | 164        |
| 4.2      | Local trigonometric bases .....                               | 170        |
| 4.2.1    | Smooth localization .....                                     | 170        |
| 4.2.2    | Locally bandlimited functions .....                           | 173        |
| 4.3      | Wavelet packet bases .....                                    | 176        |
| 4.3.1    | High- and low-pass filters .....                              | 176        |
| 4.3.2    | Subspaces and trees; splitting criteria .....                 | 178        |
| 4.4      | Information cells and tilings .....                           | 179        |
| 4.5      | The discrete Walsh model phase plane .....                    | 181        |
| 4.5.1    | Subspaces spanned by finite sets of tiles .....               | 183        |
| 4.5.2    | Tilings and the notion of best basis .....                    | 185        |

|          |                                                           |            |
|----------|-----------------------------------------------------------|------------|
| 4.6      | Phase planes for finite Abelian groups .....              | 186        |
| 4.7      | Notes .....                                               | 188        |
| <b>5</b> | <b>Fourier uncertainty principles .....</b>               | <b>191</b> |
| 5.1      | Fourier support properties .....                          | 193        |
| 5.1.1    | Benedicks' theorem .....                                  | 193        |
| 5.1.2    | Consequences of support properties .....                  | 194        |
| 5.1.3    | Uncertainty and missing data .....                        | 195        |
| 5.1.4    | Nazarov's theorem .....                                   | 196        |
| 5.2      | Growth properties and Fourier uniqueness criteria .....   | 196        |
| 5.2.1    | Hardy's theorem .....                                     | 196        |
| 5.2.2    | Beurling's theorem .....                                  | 197        |
| 5.2.3    | Gelfand-Shilov spaces .....                               | 198        |
| 5.3      | Finite uncertainty principles .....                       | 199        |
| 5.4      | Symmetry and sharp inequalities .....                     | 202        |
| 5.4.1    | The sharp Hausdorff-Young inequality .....                | 202        |
| 5.4.2    | Entropy and logarithmic Sobolev inequalities .....        | 208        |
| 5.4.3    | Other sharp inequalities .....                            | 209        |
| 5.4.4    | Pitt's inequalities .....                                 | 210        |
| 5.4.5    | Rearrangements and spectral concentration .....           | 212        |
| 5.5      | Uncertainty inequalities in phase space .....             | 213        |
| 5.5.1    | A Heisenberg inequality for the Wigner distribution ..... | 213        |
| 5.5.2    | Wigner consequences of Hausdorff-Young .....              | 214        |
| 5.5.3    | Benedicks' theorem for the Wigner distribution .....      | 215        |
| 5.5.4    | Hardy's theorem for $S(f, g)$ .....                       | 215        |
| 5.5.5    | Heisenberg's inequality and phase plane rotations .....   | 216        |
| 5.5.6    | DeBruijn's inequalities .....                             | 218        |
| 5.6      | Weighted Fourier inequalities and uncertainty .....       | 221        |
| 5.7      | Embeddings, uncertainty and Poisson summation .....       | 225        |
| 5.7.1    | Weil's approach to PSF and a generalized version .....    | 225        |
| 5.7.2    | Some necessary and sufficient conditions for PSF .....    | 228        |
| 5.7.3    | $M_1$ and PSF in particular .....                         | 230        |
| 5.7.4    | More counterexamples to PSF .....                         | 231        |
| 5.7.5    | Proof of the embedding theorem .....                      | 233        |
| 5.8      | Time-scale uncertainty principles .....                   | 234        |
| 5.9      | Notes .....                                               | 238        |
| <b>6</b> | <b>Function spaces and operator theory .....</b>          | <b>245</b> |
| 6.1      | Besov spaces: history and wavelets .....                  | 247        |
| 6.2      | Unconditional bases as best bases .....                   | 248        |
| 6.3      | Best nonlinear approximation .....                        | 251        |
| 6.3.1    | Nonlinear wavelet approximation in Besov norms .....      | 252        |
| 6.3.2    | Temlyakov's theorem and wavelet approximation .....       | 253        |
| 6.4      | Nonlinear approximation, wavelets and trees .....         | 254        |
| 6.5      | Wavelets and coding .....                                 | 257        |

|          |                                                                                       |            |
