|------------------------------------------------------------------------------------|-----------|
| <b>Preface</b>                                                                     | <b>ix</b> |
| <b>1 Maxwell's Equations and Their Geophysical Applications</b>                    | <b>1</b>  |
| 1.1 Different representations of Maxwell's equations . . . . .                     | 1         |
| 1.2 Dimensional analysis and geophysical experiments . . . . .                     | 5         |
| 1.3 Electromagnetic fields, sources, and the EM coupling problem . . . .           | 16        |
| 1.4 Some useful analytic solutions . . . . .                                       | 17        |
| 1.5 Exercises . . . . .                                                            | 20        |
| <b>2 The Finite Volume Method in 1D and Its Application to Maxwell's Equations</b> | <b>21</b> |
| 2.1 Deriving the discretization . . . . .                                          | 21        |
| 2.2 Matrix representation . . . . .                                                | 23        |
| 2.3 Implementation of boundary conditions . . . . .                                | 24        |
| 2.4 1D in practice . . . . .                                                       | 25        |
| 2.5 Programmer note: Testing the code—the method of fictitious sources             | 25        |
| 2.6 The 1D MT problem . . . . .                                                    | 28        |
| 2.7 Exercises . . . . .                                                            | 30        |
| <b>3 Finite Volume Discretization in 3D</b>                                        | <b>31</b> |
| 3.1 Discretization of differential operators on a tensor mesh . . . . .            | 31        |
| 3.2 Inner products on tensor mesh . . . . .                                        | 34        |
| 3.3 Discretization on logically orthogonal grids . . . . .                         | 36        |
| 3.4 Programming the operators using Kronecker products . . . . .                   | 45        |
| 3.5 Exercises . . . . .                                                            | 49        |
| <b>4 Discretization of Maxwell's Equations</b>                                     | <b>51</b> |
| 4.1 Discretization of Maxwell's equations in frequency . . . . .                   | 51        |
| 4.2 Statics . . . . .                                                              | 52        |
| 4.3 Programming Maxwell's equations . . . . .                                      | 53        |
| 4.4 Setting up sources . . . . .                                                   | 54        |
| 4.5 Time stepping . . . . .                                                        | 61        |
| 4.6 Solving the linear systems . . . . .                                           | 68        |
| 4.7 Example: Modeling a magnetic loop in conductive media . . . . .                | 71        |
| 4.8 Exercises for Maxwell's simulation . . . . .                                   | 76        |
| <b>5 Sensitivity Calculation</b>                                                   | <b>77</b> |
| 5.1 The concept of sensitivities . . . . .                                         | 77        |
| 5.2 The basic sensitivity equation . . . . .                                       | 77        |

|          |                                                                    |            |
|----------|--------------------------------------------------------------------|------------|
| 5.3      | Computation of the sensitivities . . . . .                         | 79         |
| 5.4      | Sensitivities of complex variables . . . . .                       | 82         |
| 5.5      | Working with sensitivities in practice . . . . .                   | 82         |
| 5.6      | Differentiating linear algebra expressions . . . . .               | 83         |
| 5.7      | Programmer note . . . . .                                          | 85         |
| 5.8      | Example: Sensitivities for the time domain model problem . . . . . | 88         |
| 5.9      | Exercises for sensitivity calculation . . . . .                    | 89         |
| <b>6</b> | <b>Data Fitting, Regularization, and Inversion</b>                 | <b>91</b>  |
| 6.1      | The misfit . . . . .                                               | 91         |
| 6.2      | Overfitting and regularization techniques . . . . .                | 93         |
| 6.3      | $L_1$ based regularization . . . . .                               | 99         |
| 6.4      | Inversion through optimization . . . . .                           | 101        |
| 6.5      | Inversion through inverse scale space methods . . . . .            | 116        |
| 6.6      | Exercises . . . . .                                                | 118        |
| <b>7</b> | <b>Large Scale Problems and Problems with Many Sources</b>         | <b>119</b> |
| 7.1      | Big data and big models . . . . .                                  | 119        |
| 7.2      | Mesh decoupling . . . . .                                          | 120        |
| 7.3      | Stochastic methods for problems with many sources . . . . .        | 123        |
| <b>8</b> | <b>Inversion in Practice</b>                                       | <b>129</b> |
| 8.1      | Electromagnetic data set . . . . .                                 | 129        |
| 8.2      | Understanding the data . . . . .                                   | 130        |
| 8.3      | Solving the inverse problem: First pass . . . . .                  | 132        |
|          | <b>Bibliography</b>                                                | <b>137</b> |
|          | <b>Index</b>                                                       | <b>143</b> |
