

Table of contents

1	Introduction.....	1
2	Brine migration in rock salt formations	3
2.1	Types of internal water in rock salt formations	5
2.2	Migration processes for water in rock salt	9
2.2.1	Migration of fluid inclusions	10
2.2.2	Migration of intercrystalline water.....	15
2.2.3	Results from selected experiments	19
2.3	Estimation of water migration into a HAW borehole	25
2.4	Résumé	30
3	The release of gaseous radionuclides and their relevance for the potential radiation exposure	33
3.1	Source term of gaseous radionuclides	34
3.1.1	Carbon-containing gases	35
3.1.2	Other Gases	39
3.2	Container corrosion and generation of non-radioactive gases	41
3.3	Release of gases from the repository	44
3.4	Transport in the geosphere	47
3.5	Dose conversion factor	48
3.6	Estimation of potential radiation exposures.....	50
3.7	Résumé	55
4	Two phase flow in the near field.....	57
4.1	Case 1: Inflow through the shaft	59
4.1.1	Variant 1a: No gas production.....	61
4.1.2	Variant 1b: Gas production	68
4.1.3	Variant 1c: Gas production, increased model resolution	75
4.2	Case 2: Flow through a low permeable sealing.....	77
4.3	Résumé	85

5	Conclusions for integrated performance assessment.....	87
	References	91
	List of Figures.....	105
	List of Tables	107
A.	Appendices	109
A.1	LOPOS simulation of brine inflow into a repository mine	109
A.2	Two-phase flow model	115
A.3	Computer codes for two-phase flow simulations.....	117
A.4	TOUGH2 input file for simulation 1 variant b.....	119
A.5	TOUGH2 input file for simulation 2 variant d.....	121
