

Table of contents

1	Introduction	1
2	The project.....	5
2.1	State of science and technology	5
2.1.1	Flow and transport modelling	5
2.1.2	Sedimentary rock	6
2.1.3	Fractured rock	6
2.1.4	Numerical procederes	8
2.1.5	Model hierarchies	10
2.1.6	Inverse modelling	13
2.2	Overall objective.....	14
2.3	The organization	16
3	Meso-scale reference model	17
3.1	Motivation.....	17
3.2	Generation of the random fields.....	19
3.2.1	Random fields	19
3.2.2	Variograms and associated spectra of random fields	20
3.2.3	Numerical generation of random fields	25
3.2.4	Assessing the quality of numerically generated random fields.....	31
3.3	Modelling of the effective parameters	34
3.3.1	The transport equation	34
3.3.2	The Darcy equation.....	35
3.3.3	The stochastic approach	35
3.3.4	Correlation functions for fluctuations with finite and infinite correlation lengths.....	36
3.4	The methods	38
3.4.1	Fourier transforms.....	38
3.4.2	Fourier-transformed velocity fluctuations	39
3.4.3	Dispersion coefficients	40

3.4.4	Transport parameters.....	41
3.4.5	The perturbation theory.....	43
3.5	Contributions due to the heterogeneities in the velocity field.....	43
3.5.1	The flow situation: Contributions due to the centre-of-mass velocity.....	44
3.5.2	The transport situation: Contributions by the dispersion coefficients.....	44
3.6	Results for transport coefficients in fractal porous media.....	46
3.6.1	General explicit expressions for the dispersion coefficients.....	48
3.6.2	The longitudinal ensemble dispersion coefficient.....	49
3.6.3	The longitudinal effective dispersion coefficient.....	51
3.6.4	Temporal behaviour of the longitudinal components D_{11}	52
3.6.5	The transverse ensemble dispersion coefficient.....	54
3.6.6	The transverse effective dispersion coefficient.....	55
3.6.7	Temporal behaviour of the transverse components D_{22}	56
3.7	Summary.....	59
4	Numerical solver for the meso-scale reference model.....	61
4.1	Higher Order Finite Volume Schemes.....	61
4.1.1	Definition of a Finite Volume Scheme of Higher Order.....	62
4.1.2	Application to the equation for density driven flow.....	64
4.1.3	Numerical test example.....	65
4.2	Filtering algebraic multigrid solver.....	66
4.2.1	Global and local minimization.....	68
4.2.2	Smoother.....	69
4.2.3	Coarsening Algorithm.....	69
4.3	Parallelization.....	70
4.3.1	The Parallel Communication Layer.....	71
4.3.2	Distributed domains.....	74
4.3.3	Parallel algebra setup.....	76
4.3.4	A parallel geometric multigrid solver on hierarchically distributed grids....	77
4.3.5	Parallelization of the FAMG solver.....	80

5	Concepts and criteria for multi-scale adaptivity	85
5.1	Motivation.....	85
5.2	Introduction	86
5.3	The method of coarse graining	88
5.3.1	Definition of the filter	88
5.3.2	Applications to the log-hydraulic conductivity field	90
5.3.3	Grid-size dependent transport equations	94
5.3.4	Grid-size dependent dispersion coefficients	98
5.4	Results for grid-size dependent transport parameters	98
5.4.1	Grid-size dependent coefficients with finite correlation lengths.....	100
5.4.2	Grid-size dependent coefficients with infinite correlation lengths.....	104
5.4.3	Temporal behaviour of the grid-size dependent coefficients in fractal media with infinite correlation lengths	106
5.5	Comparison between finite and infinite correlations lengths	112
5.6	Summary.....	113
6	Adaptive numerical multi-scale solver.....	115
6.1	Introduction	115
6.2	Model equations.....	116
6.2.1	The d -dimensional model.....	117
6.2.2	The $(d - 1)$ -dimensional model	120
6.3	Numerical methods	123
6.3.1	Computational grid	124
6.3.2	Discretisation.....	124
6.3.3	Numerical solution.....	131
6.4	Comparison of d - and $(d - 1)$ -dimensional approaches	131
6.4.1	Benchmark problems	131
6.4.2	Comparison results	133
6.5	Dimension-adaptive methods.....	137
6.5.1	Dimension-adaptive multigrid method.....	137
6.5.2	Dimension-adaptive computation.....	138
6.5.3	Numerical Experiments	142

6.6	Discussion	144
7	Development of simple models for the fast computation of flow and transport through fractured rocks	145
7.1	Introduction	145
7.2	Effective transport properties	147
7.3	Simple effective 1d-transport models	149
7.4	Analytical solution for the simple effective 1d-models	150
8	Algorithms and tools for inverse modelling and parameter estimation	153
8.1	Introduction	153
8.2	Problem definition	153
8.3	Gauß-Newton-Method	154
8.4	Implementation and Parallelization	156
8.5	Numerical Experiments	157
8.5.1	Example Gorleben	157
8.5.2	Example Saltdome	160
8.6	Conclusions	163
9	Fast predictions by random-walk methods	165
9.1	Introduction	165
9.2	Theory	166
9.3	Random walk particle tracking (RWPT) in porous media (Benchmark ADuR5-1 and ADuR5-2)	169
9.3.1	One-Dimensional Benchmark (ADuR5-1)	169
9.3.2	Three-Dimensional Benchmark (ADuR5-2)	174
9.4	RWPT in pore scale space (Benchmark ADuR13-1 and ADuR13-2)	176
9.4.1	Two-Dimensional Pore Scale Benchmark (ADuR13-1)	177
9.4.2	Three-Dimensional Pore Scale Benchmark (ADuR13-2)	183
10	Benchmarking	189
10.1	Introduction	189
10.1.1	Measurements of fracture aperture	189

10.1.2	Effective parameters: hydraulic vs. mechanical permeability.....	189
10.1.3	Benchmarks organization and responsible authors	190
10.2	Alternate numerical methods for advective transport in heterogeneous fractures (Benchmark ADuR6).....	191
10.2.1	Finite elements and finite difference method	191
10.2.2	Finite elements and random walk particle tracking (Benchmark ADuR4-1 and ADuR4-2)	195
10.3	Sorption in heterogeneous fractures (Benchmark ADuR7).....	200
10.3.1	Problem definition	201
10.3.2	Results	202
10.4	Matrix diffusion in fractured rock (Benchmarks ADuR1 and ADuR2).....	204
10.4.1	Background	204
10.4.2	Solute transport through a smooth fracture with matrix diffusion (Benchmark ADuR1)	207
10.4.3	Solute transport through a rough fracture with matrix diffusion (Benchmark ADuR2)	209
10.5	Numerical matrix diffusion: Transport in a coupled fracture-matrix system (Benchmark ADuR3).....	212
10.5.1	Problem definition	212
10.5.2	Analytical solution	213
10.5.3	Numerical solution.....	213
10.5.4	Results	215
10.6	Flow in porous media with fractures (Benchmark ADuR12).....	217
10.6.1	Problem definition	217
10.6.2	Analytical solution	218
10.6.3	Numerical solution.....	219
10.6.4	Results	220
10.7	Fracture networks: (Grimsel shear zone), flow and conservative transport (Benchmark ADuR8).....	221
10.7.1	Problem definition	221
10.7.2	Numerical solution.....	221
10.7.3	Results	222

10.8	Flow in discrete fracture-matrix systems: Flow and transport in the Grimsel 10-fracture network (Benchmark ADuR10 and ADuR11)	224
10.8.1	Motivation	224
10.8.2	Independent fracture network - Uniform aperture (Benchmark ADUR10).....	224
10.8.3	Fracture imbedded in low permeability matrix - Uniform aperture (Benchmark ADUR11)	227
11	Code verification	231
11.1	Fractured Elder problem	231
11.2	Tests using the Forchheimer correction	232
12	Preprocessing and graphical user interfaces for d³f and r³t.....	235
12.1	Introduction	235
12.2	Project Format.....	235
12.3	Improved UI-Generation.....	236
12.4	Dynamic Array Visualizations.....	238
12.4.1	Defining array visualizations	238
12.4.2	Array visualizations as container with variable element types	239
12.4.3	Creating a new project from the d3f template application	240
12.4.4	DensityDrivenFlow component: physical user data.....	241
12.4.5	KineticSolver component	247
12.4.6	VTUViewer component	250
12.5	Preparing geometries for simulating density driven flow	255
12.5.1	ProMesh.....	255
12.5.2	Construction of geometries for 2d fractured domains	256
12.5.3	Constructing geometries for 3d fractured domains	258
13	Summary	261
	References	267
	Table of Figures.....	299

	List of Tables.....	307
A	Notation.....	311
B	Explicit expressions for the dispersion coefficients without coarse graining for finite correlation length.....	315
C	Explicit expressions of the scale-dependent dispersion coefficients with finite correlation lengths (CL).....	319
D	Inverse modelling and parameter estimation.....	325
E	Publications.....	329
F	Meetings.....	339
