

Contents

1	Introduction	1
1.1	Definitions and notation	1
1.2	Existence and uniqueness	3
1.3	Gronwall's inequality	4
2	Autonomous equations	7
2.1	Phase-space, orbits	7
2.2	Critical points and linearisation	10
2.3	Periodic solutions	14
2.4	First integrals and integral manifolds	16
2.5	Evolution of a volume element, Liouville's theorem	21
2.6	Exercises	23
3	Critical points	25
3.1	Two-dimensional linear systems	25
3.2	Remarks on three-dimensional linear systems	29
3.3	Critical points of nonlinear equations	31
3.4	Exercises	36
4	Periodic solutions	38
4.1	Bendixson's criterion	38
4.2	Geometric auxiliaries, preparation for the Poincaré-Bendixson theorem	40
4.3	The Poincaré-Bendixson theorem	43
4.4	Applications of the Poincaré-Bendixson theorem	47
4.5	Periodic solutions in $\mathbb{R}^n$	53
4.6	Exercises	57
5	Introduction to the theory of stability	59
5.1	Simple examples	59
5.2	Stability of equilibrium solutions	61
5.3	Stability of periodic solutions	62
5.4	Linearisation	66
5.5	Exercises	67
6	Linear Equations	69
6.1	Equations with constant coefficients	69
6.2	Equations with coefficients which have a limit	71

6.3	Equations with periodic coefficients	75
6.4	Exercises	80
7	Stability by linearisation	83
7.1	Asymptotic stability of the trivial solution	83
7.2	Instability of the trivial solution	88
7.3	Stability of periodic solutions of autonomous equations	91
7.4	Exercises	93
8	Stability analysis by the direct method	96
8.1	Introduction	96
8.2	Lyapunov functions	98
8.3	Hamiltonian systems and systems with first integrals	103
8.4	Applications and examples	107
8.5	Exercises	108
9	Introduction to perturbation theory	110
9.1	Background and elementary examples	110
9.2	Basic material	113
9.3	Naïve expansion	116
9.4	The Poincaré expansion theorem	119
9.5	Exercises	120
10	The Poincaré-Lindstedt method	122
10.1	Periodic solutions of autonomous second-order equations	122
10.2	Approximation of periodic solutions on arbitrary long time-scales	127
10.3	Periodic solutions of equations with forcing terms	129
10.4	The existence of periodic solutions	131
10.5	Exercises	135
11	The method of averaging	136
11.1	Introduction	136
11.2	The Lagrange standard form	138
11.3	Averaging in the periodic case	140
11.4	Averaging in the general case	144
11.5	Adiabatic invariants	147
11.6	Averaging over one angle, resonance manifolds	150
11.7	Averaging over more than one angle, an introduction	154
11.8	Periodic solutions	157
11.9	Exercises	162

12 Relaxation Oscillations	166
12.1 Introduction	166
12.2 Mechanical systems with large friction	167
12.3 The van der Pol-equation	168
12.4 The Volterra-Lotka equations	170
12.5 Exercises	172
13 Bifurcation Theory	173
13.1 Introduction	173
13.2 Normalisation	175
13.3 Averaging and normalisation	180
13.4 Centre manifolds	182
13.5 Bifurcation of equilibrium solutions and Hopf bifurcation	186
13.6 Exercises	190
14 Chaos	193
14.1 Introduction and historical context	193
14.2 The Lorenz-equations	194
14.3 Maps associated with the Lorenz-equations	197
14.4 One-dimensional dynamics	199
14.5 One-dimensional chaos: the quadratic map	203
14.6 One-dimensional chaos: the tent map	207
14.7 Fractal sets	208
14.8 Dynamical characterisations of fractal sets	213
14.9 Lyapunov exponents	216
14.10 Ideas and references to the literature	218
15 Hamiltonian systems	224
15.1 Introduction	224
15.2 A nonlinear example with two degrees of freedom	226
15.3 Birkhoff-normalisation	230
15.4 The phenomenon of recurrence	233
15.5 Periodic solutions	236
15.6 Invariant tori and chaos	238
15.7 The KAM theorem	242
15.8 Exercises	246
Appendix 1: The Morse lemma	248
Appendix 2: Linear periodic equations with a small parameter	250
Appendix 3: Trigonometric formulas and averages	252

Appendix 4: A sketch of Cotton's proof of the stable and unstable manifold theorem 3.3	253
Appendix 5: Bifurcations of self-excited oscillations	255
Appendix 6: Normal forms of Hamiltonian systems near equilibria	260
Answers and hints to the exercises	267
