Preface	vii
1 Introduction	1
1.1 Groundwater Quality	1
1.2 Groundwater Quality Management	2
1.3 Groundwater Modeling	4
2 Hydrodynamic Dispersion in Porous Media	9
2.1 Physical Parameters	9
2.1.1 Spatial Average Method	9
2.1.2 Fluid, Medium and State Parameters	12
2.2 Phenomena and Mechanism of Hydrodynamic Dispersion	20
2.2.1 Hydrodynamic Dispersion Phenomena	20
2.2.2 Mechanisms of Hydrodynamic Dispersion	21
2.2.3 Mass Transport in Porous Media	23
2.3 Mass Conservation and Convection-Diffusion Equations in a Fluid Continuum	24
2.3.1 Diffusive Velocities and Fluxes	24
2.3.2 Mass Conservation Equation of a Component	25
2.3.3 Convection-Diffusion Equations in a Fluid Continuum	26
2.4 Hydrodynamic Dispersion Equations	27
2.4.1 The Average of Time Derivatives	27
2.4.2 The Average of Spatial Derivatives	29
2.4.3 Advection-Dispersion Equations in Porous Media	30
2.4.4 The Integral Form of Hydrodynamic Dispersion Equations ..	32
2.5 Coefficients of Hydrodynamic Dispersion	33
2.5.1 Coefficients of Longitudinal Dispersion and Transverse Dispersion	33
2.5.2 Coefficients of Mechanical Dispersion and Molecular Diffusion	36
2.6 Extensions and Subsidiary Conditions of the Hydrodynamic Dispersion Equation	39

2.6.1 Hydrodynamic Dispersion Equations in Orthogonal Curvilinear Coordinate Systems	39
2.6.2 Extensions of Hydrodynamic Dispersion Equations	41
2.6.3 Initial and Boundary Conditions	44
3 Analytical Solutions of Hydrodynamic Dispersion Equations	50
3.1 Superposition of Fundamental Solutions	50
3.1.1 The Fundamental Solution of a Point Source	50
3.1.2 Superposition Principle and Image Method	52
3.1.3 Continuous Injection in a Uniform Flow Field	54
3.2 Some Canonical Problems Having Analytical Solutions	56
3.2.1 One-Dimensional Dispersion Problems	56
3.2.2 Two- and Three-Dimensional Dispersion Problems	61
3.2.3 Radial Dispersion Problems	66
3.2.4 Dispersion Problems in Fractured Rock	69
4 Finite Difference Methods and the Method of Characteristics for Solving Hydrodynamic Dispersion Equations	73
4.1 Finite Difference Methods	73
4.1.1 Finite Difference Approximations of Derivatives	73
4.1.2 Finite Difference Solutions of One-Dimensional Dispersion Problems	75
4.1.3 Numerical Dispersion and Overshoot	80
4.1.4 Finite Difference Solutions of Two- and Three-Dimensional Dispersion Problems	83
4.2 The Method of Characteristics	84
4.2.1 Basic Idea of the Method of Characteristics	84
4.2.2 Computation of the Advection Part	85
4.2.3 Computation of the Dispersion Part	88
4.2.4 Treatment of Boundary Conditions and Sink/Source Terms	89
4.2.5 The Random-Walk Model	91
5 Finite Element Methods for Solving Hydrodynamic Dispersion Equations	97
5.1 Finite Element Methods for Two-Dimensional Problems	97
5.1.1 The Weighted Residual Method	97
5.1.2 Finite Element Discretization and Basis Functions	101
5.1.3 High-Order Elements and Hermite Elements	105
5.1.4 Isoparametric Finite Elements	109
5.1.5 Treatment of Boundary Conditions	113
5.2 The Multiple Cell Balance Method	115
5.2.1 Governing Equations	115
5.2.2 An Algorithm Based on Multiple Cell Balance	116
5.2.3 Comparing with the Finite Element Method	122
5.2.4 The Test of Numerical Solutions	123

5.3 Finite Element Methods for Three-Dimensional Problems	125
5.3.1 The Galerkin Finite Element Method	125
5.3.2 Triangular Prism Elements and Associated Basis Functions ..	132
5.3.3 A Mixed Finite Element-Finite Difference Method	135
5.3.4 The Multiple Cell Balance Method	138
5.4 The Solution of Finite Element Systems	143
5.4.1 Features of Finite Element Systems and Direct Solutions ...	143
5.4.2 Point Iteration Methods	144
5.4.3 Block and Layer Iteration Methods	146
6 Numerical Solutions of Advection-Dominated Problems	149
6.1 Advection-Dominated Problems	149
6.1.1 Fourier Analysis of Numerical Errors	149
6.1.2 Eulerian and Lagrangian Reference Frames	154
6.2 Upstream Weighted Methods	155
6.2.1 Upstream Weighted Finite Difference Methods	155
6.2.2 Upstream Weighted Finite Element Methods	158
6.2.3 The Upstream Weighted Multiple Cell Balance Method	163
6.3 Moving Coordinate System and Moving Point Methods	172
6.3.1 Moving Coordinate System Methods	172
6.3.2 Element Deformation Methods	175
6.3.3 Moving Point Methods	176
6.4 The Modified Methods of Characteristics	177
6.4.1 The Single Step Reverse Method	177
6.4.2 The Hybrid Single Step Reverse-Moving Point Method	180
6.4.3 The Hybrid Moving Point-Characteristics Finite Element Method	182
7 Mathematical Models of Groundwater Quality	187
7.1 The Classification of Groundwater Quality Models	187
7.1.1 Hydrodynamic Dispersion Models	187
7.1.2 Coupled Equations of Groundwater Flow and Mass Transport	191
7.1.3 Pure Advection Models	193
7.1.4 Lumped Parameter Models	196
7.1.5 Criteria of Model Selection	199
7.2 Model Calibration and Parameter Estimation	201
7.2.1 Parameter Identification of Advection-Dispersion Equations	201
7.2.2 Field Experiments for Determining Dispersivities	204
7.2.3 The Relationship Between Values of Dispersivity and Scales of Experiment	213
7.2.4 Determination of Mean Flow Velocities	217
7.2.5 Identification of Retardation Factor and Chemical Reaction Parameters	218
7.2.6 Identification of Pollutant Sources	219
7.2.7 Computer Aided Design for Field Experiments	220

7.3 Coupled Inverse Problems of Groundwater Flow and Mass Transport	223
7.3.1 Definition of Coupled Inverse Problems	223
7.3.2 Variational Sensitivity Analysis	226
7.3.3 Identifiability	231
7.3.4 Experimental Design	234
7.4 Statistic Theory and Uncertainty Analysis	235
7.4.1 The Statistic Theory of Mass Transport in Porous Media	235
7.4.2 The Heterogeneity of Natural Formations	236
7.4.3 Stochastic Advection-Dispersion Equations and Macrodispersivities	237
7.4.4 Uncertainties of Groundwater Quality Models	238
7.4.5 Conditional Simulations and Stochastic Inverse Problems	243
8 Applications of Groundwater Quality Models	247
8.1 Simulation and Prediction of Groundwater Pollution	247
8.1.1 The General Procedure of Studying Groundwater Pollution Problems	247
8.1.2 Groundwater Pollution of Saturated Loose Aquifers	250
8.1.3 Groundwater Pollution of Saturated-Unsaturated Aquifers	253
8.1.4 Groundwater Pollution of Fractured Aquifers	256
8.2 Seawater Intrusion	262
8.2.1 The Problem of Seawater Intrusion	262
8.2.2 Fresh Water-Sea Water Interfaces	264
8.2.3 Numerical Methods for Determining the Location of Interfaces	269
8.2.4 Determination of the Transition Zones	271
8.3 Groundwater Quality Management Models	275
8.3.1 Groundwater Hydraulic Management Models	275
8.3.2 Management of Groundwater Pollution Sources	280
8.3.3 Project Models of Groundwater Quality Management	284
8.3.4 Conjunctive Use and Water Resources Planning	287
8.3.5 Remediation of Polluted Aquifers	288
8.3.6 The Reliability of Management Models	289
8.3.7 Economic and Political Models in Groundwater Management	291
Conclusions	295
Appendix A The Related Parameters in the Modeling Mass Transport in Porous Media	297
Appendix B A FORTRAN Program for Solving Coupled Groundwater Flow and Contaminant Transport Problems	300
B.1 Features and Assumptions	300
B.2 Program Structure	301

B.3 Input Data Files	301
B.4 Output Data Files	305
B.5 Floppy Disk and Demo Problem	306
B.6 Source Programs	307
References	355
Index	370
