

Geoelectromagnetic Waves

A V Guglielmi and O A Pokhotelov

**Institute of the Physics of the Earth
Russian Academy of Sciences, Moscow, Russia**

**Institute of Physics Publishing
Bristol and Philadelphia**

Contents

Preface	xi
Notation	xiii
Introduction	xvii
1 The Earth's crust	1
1.1 Seismic waves	1
Exercises	8
1.2 The inductive seismomagnetic effect	10
1.2.1 Body waves	12
1.2.2 The electromagnetic field of the Rayleigh wave	14
1.2.3 Comparison with observations	16
Exercises	17
1.3 The inertial seismomagnetic effect	18
1.3.1 The Tolman–Stewart effect in the Earth's crust	20
1.3.2 Virtual mass	21
1.3.3 The equation of magnetic signal generation	22
1.3.4 The electromagnetic field of an elastic wave in a porous body	23
Bibliography	24
2 Ocean	27
2.1 Magnetohydrodynamics	28
2.1.1 Equations of magnetohydrodynamics	28
2.1.2 Magnetohydrodynamic waves	31
2.2 Perturbation of the geomagnetic field by ocean waves	33
2.2.1 Waves on the surface of water	34
2.2.2 Magnetic field of gravity waves	36
Exercises	40
Bibliography	42

3	Atmosphere and ionosphere	44
3.1	Global resonances of the Earth–ionosphere cavity	44
3.1.1	Elementary theory	45
3.1.2	The gradient of the surface impedance of the Earth	48
3.1.3	Comparison with observations	49
3.1.4	Ionospheric inhomogeneity	51
	Exercises	55
3.2	The ionosphere as a reflector and transmitter	58
3.2.1	Dielectric permeability of the magnetoactive plasma	59
3.2.2	The wave equation and boundary conditions	63
3.2.3	Alfvén waves	67
3.2.4	Magnetosonic waves	69
	Exercises	69
3.3	The ionosphere as a resonator and waveguide	75
	Bibliography	79
4	The magnetosphere	83
4.1	Waves in a cold plasma	84
	Exercises	89
4.2	Ray theory	93
	Exercises	97
4.3	A transverse waveguide under the arch of plasmasphere	102
4.4	Longitudinal waveguides	105
4.4.1	Pearls at conjugate points	105
4.4.2	Longitudinal channelling of L - and R -waves	107
	Exercise	111
4.5	Oscillations of magnetic shells	111
4.5.1	The equation of toroidal oscillations	112
4.5.2	Fast and slow subsystems	113
4.5.3	Transverse rays and longitudinal modes	115
4.5.4	The Dungey spectrum	115
	Exercises	118
4.6	Resonance in the caustic shadow	123
4.6.1	Formulation of the MHD problem	124
4.6.2	Analogy with the Försterling problem	126
4.6.3	Resonance structure	127
	Exercise	129
	Bibliography	129
5	Modulation	136
5.1	Wave packets	136
5.1.1	Group velocity	136
5.1.2	Dispersive broadening of the wave packet	138
	Exercise	142

5.2	Impulses	143
5.2.1	The method of stationary phases	143
5.2.2	Green's function of the propagation trace	145
5.2.3	Tweaks, whistlers and pearls	147
5.2.4	Propagation of waves in a moving plasma	154
	Exercise	157
	Bibliography	157
6	Instability	160
6.1	The method of kinetic equations	160
6.2	Self-excitation of waves in a transverse waveguide	166
6.2.1	The dispersion equation	166
6.2.2	Instability growth rate	168
6.2.3	Formation of nonmonotonic proton distribution during a magnetic storm	170
6.2.4	Comparison with the observational data	175
6.3	Self-excitation of longitudinal waveguides	177
6.3.1	The local dispersion equation	178
6.3.2	Mechanism of anisotropy formation	181
6.3.3	Instability growth rate	181
6.3.4	Longitudinal inhomogeneity	184
6.3.5	The mystery of 'pearls'	186
6.4	Origin of pulsations of rising frequency	187
6.4.1	General picture of waves	188
6.4.2	The mechanism for the formation of unstable distributions	189
6.4.3	Analysis of the growth rate	191
6.4.4	Discussion	193
	Exercise	195
6.5	Pulsations of extramagnetospheric origin	196
6.5.1	The main type of geomagnetic pulsation	196
6.5.2	On the dual nature of Pc2 pulsations	202
6.5.3	Hydromagnetic aureola of planets	206
6.5.4	Serpentine emission	207
6.5.5	Discrete signals	211
	Exercises	214
	Bibliography	219
7	Nonlinearity	227
7.1	Ponderomotive forces	228
7.1.1	Equatorial plasma condensation	229
7.1.2	Polar wind acceleration	233
	Exercise	235
7.2	Solitons	236

7.2.1	The nonlinear Schrödinger equation	236
7.2.2	The search for solitons	242
7.2.3	Solitons in an active medium	244
	Exercises	247
7.3	Vortices	250
7.3.1	Classification of Alfvén vortices	253
7.3.2	Observations of Alfvén vortices	257
	Bibliography	263
8	Fluctuational and critical phenomena	266
8.1	Phenomenological modelling	266
8.1.1	Autogenerator or filter?	267
8.1.2	Fluctuations near threshold	267
8.1.3	A black box without an input	269
	Exercise	271
8.2	An auto-oscillatory model of pulsations	271
8.2.1	Selection of the pulsation type	272
8.2.2	Limiting cycle	274
8.2.3	Rigidity and nonisochronicity	276
8.2.4	Amplitude and phase fluctuations	278
8.2.5	The search for stochastic attractors	279
8.3	Phenomenology of magnetic storms	280
8.3.1	D_{st} -variation model	280
8.3.2	Stochastic equivalent of the RBM model	282
8.3.3	Sources and sinks	284
8.3.4	Multiplicative noise	286
	Bibliography	288
9	Hydromagnetic diagnostics and geoelectric prospecting	290
9.1	Introductory comments	290
9.2	Surface impedance of the Earth	292
9.2.1	Magnetotelluric sounding	292
9.2.2	The Leontovich boundary condition	295
9.2.3	The impedance equation	297
9.2.4	Gradient of the surface impedance	298
9.2.5	On the search for an earthquake's precursors	299
	Exercises	300
9.3	Diagnostics of the magnetosphere	302
9.3.1	The MHD locator	302
9.3.2	Diagnostics based on oscillation spectra	306
9.3.3	Diagnostics by the signal repetition period	308
	Exercises	310
9.4	Interplanetary medium diagnostics	318
9.4.1	Interplanetary magnetic field	318

9.4.2	Solar wind velocity	320
9.4.3	On the applications of hydromagnetic diagnostics	323
	Bibliography	327
10	Epilogue: geoelectromagnetic waves and man	333
	Addenda	335
A.1	Geophysical values	335
A.2	Classification	343
A.3	Methods of research	345
A.4	Man-made waves	348
	References	351
	Index	379
