|------------------------------------------------------------------------------------------------------------|-----------|
| <b>INTRODUCTION</b>                                                                                        | <b>1</b>  |
| <b>1 PULSE DISPERSION AND PULSE VELOCITY</b>                                                               | <b>5</b>  |
| 1.1 Establishing the Problem of Pulse Propagation and an Approach to Its Solution . . . . .                | 5         |
| 1.1.1 General aspects of the problem . . . . .                                                             | 5         |
| 1.1.2 The use of the one-sided Fourier transform for pulse propagation problems . . . . .                  | 6         |
| 1.1.3 Investigation of the pulse asymptotes by the reference integrals technique . . . . .                 | 8         |
| 1.1.4 The reference pulses . . . . .                                                                       | 11        |
| 1.1.5 A comment on the spatial Fourier transform . . . . .                                                 | 13        |
| 1.2 The Velocity of a Signal Propagation . . . . .                                                         | 14        |
| 1.2.1 Velocity in mechanics . . . . .                                                                      | 14        |
| 1.2.2 The difficulties associated with defining signal velocity . . . .                                    | 14        |
| 1.2.3 The group velocity . . . . .                                                                         | 18        |
| 1.2.4 Velocity of energy propagation and information transmission .                                        | 22        |
| 1.3 A Signal Velocity in Non-Equilibrium and Dissipative Media . . . .                                     | 22        |
| 1.3.1 A paradox of infinitely high group velocity . . . . .                                                | 23        |
| 1.3.2 An example of an unstable medium . . . . .                                                           | 24        |
| 1.3.3 An example of a dissipative medium . . . . .                                                         | 28        |
| 1.3.4 The crucial role of non-linear corrections at the boundaries of an interval of instability . . . . . | 29        |
| 1.3.5 The uncertainty principle for a signal spectrum and its 'tails' .                                    | 30        |
| <b>2 HISTORY DEPENDENT MEDIA</b>                                                                           | <b>31</b> |
| 2.1 Wave Equation for History Dependent Media . . . . .                                                    | 31        |
| 2.1.1 Basic equations . . . . .                                                                            | 32        |
| 2.1.2 Kneser's relaxation . . . . .                                                                        | 33        |
| 2.1.3 The resonant relaxation . . . . .                                                                    | 35        |
| 2.1.4 Heat-exchange relaxation . . . . .                                                                   | 37        |
| 2.2 Pulses in Media with Kneser's Relaxation . . . . .                                                     | 40        |
| 2.2.1 $\delta$ -pulse . . . . .                                                                            | 40        |
| 2.2.2 $\theta$ -shaped and dotting waveforms . . . . .                                                     | 46        |
| 2.2.3 Modulated $\theta$ -shaped signals . . . . .                                                         | 51        |

|          |                                                                                                      |            |
|----------|------------------------------------------------------------------------------------------------------|------------|
| 2.3      | Pulses in Resonant Relaxation Media . . . . .                                                        | 57         |
| 2.3.1    | $\delta$ -shaped pulse . . . . .                                                                     | 58         |
| 2.3.2    | The dotting (rectangular) signal . . . . .                                                           | 65         |
| 2.3.3    | Switching on a tonal signal . . . . .                                                                | 67         |
| 2.3.4    | The dotting signal with modulation . . . . .                                                         | 73         |
| 2.4      | Pulses in Media with Heat-Exchange Relaxation . . . . .                                              | 75         |
| 2.4.1    | The singularities of the signal spectrum . . . . .                                                   | 75         |
| 2.4.2    | $\delta$ -shaped pulse . . . . .                                                                     | 76         |
| 2.4.3    | Dotting (rectangular) pulses . . . . .                                                               | 78         |
| 2.4.4    | Switching on a harmonic signal . . . . .                                                             | 79         |
| 2.5      | Higher Dimensional Problems . . . . .                                                                | 80         |
| 2.5.1    | The Green's function for Kneser's relaxation medium . . . . .                                        | 80         |
| 2.5.2    | The Green's function for general cases . . . . .                                                     | 86         |
| <b>3</b> | <b>PULSES IN STRATIFIED MEDIA</b>                                                                    | <b>87</b>  |
| 3.1      | Pulses of Acoustic-Gravity Waves . . . . .                                                           | 87         |
| 3.1.1    | Basic equations . . . . .                                                                            | 87         |
| 3.1.2    | Field of a harmonic source . . . . .                                                                 | 89         |
| 3.1.3    | Asymptote of the field generated by an instantaneous point source . . . . .                          | 94         |
| 3.1.4    | Switching on a harmonical source . . . . .                                                           | 104        |
| 3.1.5    | The observability of described effects . . . . .                                                     | 109        |
| 3.2      | Adaptation of Initial Conditions to fit the Model of an Incompressible Fluid . . . . .               | 109        |
| 3.2.1    | Explosion in an incompressible fluid . . . . .                                                       | 109        |
| 3.2.2    | Adaptation of initial conditions . . . . .                                                           | 110        |
| 3.2.3    | The 'fast time' transient behaviour . . . . .                                                        | 114        |
| 3.3      | Pulse-like Harmonic Internal Wave Fields in an Incompressible Medium                                 | 115        |
| 3.3.1    | An analogy of the 2D harmonic internal waves fields with the 1D acoustic pulse propagation . . . . . | 116        |
| 3.3.2    | The 3D internal wave field of a localized harmonic source . . . . .                                  | 120        |
| 3.4      | Non-Stationary Localized Source of Internal Waves . . . . .                                          | 121        |
| 3.4.1    | Internal wave field of an instantaneous point source . . . . .                                       | 122        |
| 3.4.2    | Switching on a monochromatic source . . . . .                                                        | 127        |
| <b>4</b> | <b>PULSES IN SHEAR FLOWS</b>                                                                         | <b>129</b> |
| 4.1      | Dispersion of a Wave Packet in a Shear Flow . . . . .                                                | 129        |
| 4.1.1    | Linearized equation for small perturbations in a plane- parallel shear flow . . . . .                | 130        |
| 4.1.2    | Evolution of the 2D perturbations in the Couette flow . . . . .                                      | 131        |
| 4.1.3    | The concept of a CS-Mode . . . . .                                                                   | 134        |
| 4.1.4    | Historical remark . . . . .                                                                          | 136        |

|          |                                                                                                                                   |            |
