

# **Theory of Linear Algebraic Equations with Random Coefficients**

**Vyacheslav L. Girko**

---

**Allerton Press, Inc./New York**

## Contents

|                                                                                                                                                     |      |
|-----------------------------------------------------------------------------------------------------------------------------------------------------|------|
| List of Basic Notations and Assumptions                                                                                                             | xiii |
| Introduction                                                                                                                                        | xvi  |
| <b>Chapter 1. Spectral Theory of Estimating Parameters of<br/>a System of Linear Equations</b>                                                      | 1    |
| 1. Perturbation Formulas for Eigenvalues and Eigenvectors of Matrix                                                                                 | 2    |
| 2. Theorem on the Extremal Values of Bounded Function                                                                                               | 3    |
| 3. The Main Spectral Equation. The Method of Random<br>Matrix Regularization                                                                        | 5    |
| 4. The Classical Least Squares Method                                                                                                               | 8    |
| 5. Spectral Equation $S_1$ for Minimax Estimators of<br>Parameters in Linear Models                                                                 | 9    |
| 6. Linear Models with Unknown Covariance Matrix. Spectral Equation $S_2$                                                                            | 17   |
| 7. Linear Models with Nonrandom Perturbations. Spectral Equation $S_3$                                                                              | 17   |
| 8. Spectral Equation $S_4$ for the Estimators of the Solutions of Systems of Equations<br>with "Internal" Perturbations in a System of Observations | 18   |
| 9. Linear Models with an Arbitrary Set of Perturbations. Spectral Equation $S_5$                                                                    | 20   |
| 10. Estimation of States of Some Recursively Defined Systems                                                                                        | 22   |
| 11. Estimation of Dynamic System States                                                                                                             | 24   |
| 12. Estimation of Linear Regression Models in Hilbert Space                                                                                         | 27   |
| <b>Chapter 2. Determinant Conditions for the Existence of Solutions of SLAERC</b>                                                                   | 30   |
| 1. Formulation of the Problem                                                                                                                       | 30   |
| 2. Limit Theorem for the Sum of Martingale Differences                                                                                              | 31   |
| 3. Limit Theorem of the Type of Large Numbers Law for Random Determinants                                                                           | 31   |
| 4. The Central Limit Theorem for Random Determinants                                                                                                | 32   |
| 5. The Method of Perpendiculars                                                                                                                     | 35   |
| 6. Resolvent Formulas for Matrix with Independent Pairs of its Entries                                                                              | 36   |
| 7. The Theorem of the Type of Large Numbers Law and the Central Limit Theorem<br>for Determinant of Random Gram Matrix                              | 37   |
| 8. Method of Normal Random Regularization for Determinants                                                                                          | 40   |
| 9. Logarithmic Law for Random Determinants                                                                                                          | 43   |
| 10. Logarithmic Law for Random Determinants with Small Errors in Entries                                                                            | 46   |

|                                                                                                                                  |        |
|----------------------------------------------------------------------------------------------------------------------------------|--------|
| <b>Chapter 3. Distribution Function of Solution of SLAERC and Integral Representation Method</b>                                 | 50     |
| 1. Random Condition Number                                                                                                       | 50     |
| 2. SLAERC with Normally Distributed Coefficients                                                                                 | 51     |
| 3. Distribution of Eigenvalues and Eigenvectors of Random Matrices                                                               | 51     |
| 4. Spectral Method for the Calculation of Moments for Solutions of SLAERC                                                        | 52     |
| 5. The Stochastic Least Squares Method                                                                                           | 53     |
| 6. Arctangent Law                                                                                                                | 53     |
| 7. Stochastic Leontief Model                                                                                                     | 54     |
| 8. Integral Representation for Determinants                                                                                      | 54     |
| 9. Limit Theorem for Random Determinants                                                                                         | 54     |
| 10. Integral Representation Method for Solutions of SLAERC                                                                       | 55     |
| 11. Integral Representation for Solutions of Differential Equations of the Second Order                                          | 56     |
| 12. Simulation in Linear Algebra                                                                                                 | 56     |
| <br><b>Chapter 4. The Spectral Conditions for the Existence and Boundedness of the Solutions of SLAERC with Large Dimension</b>  | <br>59 |
| 1. Canonical Equation $C_5$ for $G$ -Density and $L_5$ Equation for the Boundary Points of $G$ -Density                          | 59     |
| 2. Canonical Equation. Limit Theorem for Normalized Spectral Functions                                                           | 67     |
| 3. The REFORM Method of Deriving the Main Equation of Spectral Theory of Random Matrices                                         | 70     |
| 4. Inequalities for the Coefficients of the Main Equation                                                                        | 72     |
| 5. Calculations of Coefficients of the Main Equation                                                                             | 75     |
| 6. Invariance Principle for Random Matrices                                                                                      | 77     |
| 7. Equation for the Sum of Smoothed Distribution Functions of Singular Values of Random Matrices                                 | 81     |
| 8. The Method of Fourier and Inverse Fourier Transforms for Finding Boundaries of Eigenvalues                                    | 82     |
| 9. Random Perturbation Method for the Eigenvalues                                                                                | 88     |
| 10. Limit Theorem for the Singular Values of Random Matrices                                                                     | 88     |
| 11. Canonical Spectral Equation and $L_4$ Equation for the Boundary Points of the Spectral Density of Symmetric Random Matrices  | 91     |
| 12. Limit Theorem for Eigenvalues of Random Symmetric Matrices                                                                   | 92     |
| 13. Conditions for the Existence and Boundedness of the Solutions of SLAERC of Large Dimension                                   | 93     |
| 14. Spectral Conditions for the Existence of SLAERC Solutions                                                                    | 94     |
| <br><b>Chapter 5. The Circular, Elliptic, and Uniform Laws and <math>V</math>-Density for the Eigenvalues of Random Matrices</b> | <br>95 |
| 1. Outline of the Proof of Circular and Elliptic Laws (Girko, 1985)                                                              | 95     |

|                                                                                                                   |     |
|-------------------------------------------------------------------------------------------------------------------|-----|
| 2. Spectral and $G$ -Functions                                                                                    | 97  |
| 3. General $V$ -Transform of Spectral Functions                                                                   | 98  |
| 4. Truncated $V_1$ -Transform and $V_2$ -Transform                                                                | 99  |
| 5. Conditional $V_3$ -Transform and $V_4$ -Transform                                                              | 101 |
| 6. Canonical Spectral Equation and $L_5$ Equation for the<br>Boundary Points of Spectral Density                  | 102 |
| 7. Canonical Equation. Limit Theorems for Spectral Singular Functions                                             | 105 |
| 8. The REFORM Method of Deriving the Main Equation of<br>the Spectral Theory of a Random Matrix                   | 108 |
| 9. Inequalities for the Coefficients of the Main Equation                                                         | 110 |
| 10. Calculations of Coefficients of the Main Equation                                                             | 113 |
| 11. Invariance Principle for Random Matrices                                                                      | 115 |
| 12. The Equation for the Sum of Smoothed Distribution<br>Functions of Eigenvalues of Random Matrices              | 119 |
| 13. The Method of Fourier and Inverse Fourier Transforms<br>for Finding Boundaries of Eigenvalues                 | 120 |
| 14. Limit Theorem for the Singular Values of Random Matrices                                                      | 122 |
| 15. The Method of Perpendiculars for Proving the Circular Law                                                     | 122 |
| 16. Central Limit Theorem for Randomly Normalized Random Determinants                                             | 123 |
| 17. Substitution of Normally Distributed Random Variables<br>for the Entries of Random Matrices                   | 125 |
| 18. Substitution of the Determinant of Gram Matrix for the Determinant of Matrix                                  | 126 |
| 19. Regularized $V_5$ -Transform                                                                                  | 129 |
| 20. Calculation of a Certain Integral                                                                             | 130 |
| 21. Limit Theorem for Fourier Transforms of Spectral Functions and<br>Normalized Regularized Random Determinants  | 131 |
| 22. Inverse Formula for the Stieltjes Transform of Limit Spectral<br>Function of Non-Self-Adjoint Random Matrices | 132 |
| 23. Regularized $V_6$ -Transform. The Circular Law                                                                | 133 |
| 24. Limit Theorems for the Eigenvalues of Random Matrices<br>with Independent Entries                             | 134 |
| 25. The Elliptic Law                                                                                              | 136 |
| 26. Limit Theorems for the Eigenvalues of Random Nonsymmetric Matrices                                            | 137 |
| 27. The $V$ -Density of Eigenvalues of Random Matrices with Independent<br>Pairs of Entries                       | 137 |
| 28. The $V$ -Density of Eigenvalues of Random Matrices<br>with Independent Entries                                | 139 |
| 29. Examples of the $G$ -Region of $V$ -Density for Eigenvalues<br>of Random Matrices with Independent Entries    | 139 |

|                                                                                                                                       |     |
|---------------------------------------------------------------------------------------------------------------------------------------|-----|
| <b>Chapter 6. Canonical Equation for the Solutions of a System of Linear Algebraic Equations with Independent Random Coefficients</b> | 146 |
| 1. Formulation of the Problem                                                                                                         | 147 |
| 2. The Complex Regularization and Integro-Differential Representation for Solutions of SLAE                                           | 147 |
| 3. REFORM Method                                                                                                                      | 148 |
| 4. Limit Theorems for Entries of the Resolvent of Random Matrices                                                                     | 149 |
| 5. Analytic Continuation of Entries of Resolvents                                                                                     | 155 |
| 6. Calculation of the Derivative of a Resolvent of a Random Matrix                                                                    | 155 |
| 7. The Main Assertion                                                                                                                 | 156 |
| 8. The Canonical Equation                                                                                                             | 157 |
| 9. The SLAERC with Special Structure of a Matrix of Coefficients                                                                      | 160 |
| 10. Canonical Equation for the Solution of SLAERC whose Coefficients have Identity Variances                                          | 162 |
| <br><b>Chapter 7. System of Linear Algebraic Equations with Symmetric Block Matrix Structure</b>                                      | 165 |
| 1. Formulation of the Problem                                                                                                         | 165 |
| 2. Block Matrices                                                                                                                     | 166 |
| 3. REFORM Method. Formula for Diagonal Blocks of Resolvent                                                                            | 167 |
| 4. REFORM Method. Perturbation Formulas for Blocks of Symmetric Matrices                                                              | 168 |
| 5. The Boundedness of Norms of Resolvent Blocks                                                                                       | 169 |
| 6. Limit Theorem for Random Matrix Polynomial Functions of the Second Order                                                           | 169 |
| 7. Limit Theorems for the Solution of SLAERC with Independent Symmetric Block Structure                                               | 172 |
| 8. The Canonical Equation for Random Block Matrices                                                                                   | 175 |
| 9. Canonical Equation for the Solution of SLAERC with Independent Symmetric Block Structure                                           | 176 |
| 10. Examples                                                                                                                          | 177 |
| <br><b>Chapter 8. Canonical Equation for SLAERC with Nonsymmetric Block Matrix of Coefficients</b>                                    | 181 |
| 1. Nonsymmetric Block Matrices                                                                                                        | 181 |
| 2. REFORM Method. Formula for Blocks of Gram Matrix                                                                                   | 182 |
| 3. Inequality for Random Quadratic Forms                                                                                              | 184 |
| 4. Limit Theorems for Solutions of SLAERC with Independent Random Block Structure                                                     | 184 |
| 5. Analytic Continuation of Entries of Resolvents                                                                                     | 187 |
| 6. The Canonical Equation for Random Block Matrices                                                                                   | 187 |
| 7. Canonical Equation for SLAERC with Block Structure                                                                                 | 188 |

|                                                                                                                                                  |     |
|--------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| <b>Chapter 9. System of Linear Algebraic Equations with Asymptotically Independent Symmetric Blocks</b>                                          | 191 |
| 1. Formulation of the Problem                                                                                                                    | 191 |
| 2. Method of Thinning Matrices: Block Matrices                                                                                                   | 192 |
| 3. The $G$ -Condition of Asymptotic Independence of Blocks of Symmetric Random Matrices                                                          | 192 |
| 4. Method of Shortening Entries of Blocks of Random Matrices                                                                                     | 193 |
| 5. Limit Theorems for Quadratic Forms of Asymptotically Independent Random Blocks                                                                | 195 |
| 6. The $M$ -Condition of Asymptotic Independence of Random Blocks                                                                                | 197 |
| 7. Limit Theorems for the Solution of SLAERC with Asymptotically Independent Symmetric Blocks Structure                                          | 197 |
| <br><b>Chapter 10. The Canonical Equation for Solutions of SLAERC with Nonsymmetric Matrix of Asymptotically Independent Random Coefficients</b> | 199 |
| 1. Formulation of the Problem                                                                                                                    | 199 |
| 2. Method of Thinning Matrices: Block Matrices                                                                                                   | 200 |
| 3. The Condition of Asymptotic Independence of Blocks of Random Matrices                                                                         | 200 |
| 4. Limit Theorems for Quadratic Forms of Asymptotically Independent Random Blocks                                                                | 201 |
| 5. Limit Theorems for Solutions of SLAERC with an Asymptotically Independent Random Block                                                        | 204 |
| 6. Canonical Equation for SLAERC under the $M$ -Condition                                                                                        | 205 |
| <br><b>Chapter 11. <math>G</math>-Normal Statistical Estimators for Solutions of SLAE</b>                                                        | 206 |
| 1. Formulation of the Problem and Generalized $G$ -Condition for SLAERC                                                                          | 206 |
| 2. Integral Representation for the $G$ -Estimator of the Solution of SLAE                                                                        | 207 |
| 3. Martingale Representation for the Solution of SLAERC                                                                                          | 208 |
| 4. Substitution of Coefficients of SLAERC for Normally Distributed Random Variables                                                              | 209 |
| 5. Substitution of the Solution of SLAERC for a Solution of the Accompanying Canonical Equation                                                  | 210 |
| 6. Calculation of the Partial Derivatives for Resolvents                                                                                         | 211 |
| 7. Existence of Solutions of the Main Equation of $G_g$ -estimator                                                                               | 212 |
| 8. Some Formulas for the Derivative of the Resolvent of Random Matrices                                                                          | 213 |
| 9. The Main Formula for Estimator $G_g$                                                                                                          | 213 |
| 10. Limit Theorems for Random Quadratic Forms                                                                                                    | 214 |
| 11. Convergence of a Solution of an Accompanying Canonical Equation to the Solution of a Canonical Equation                                      | 218 |
| 12. A Replacement of Random Solution                                                                                                             | 220 |

|                                                                                                                                           |     |
|-------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 13. Asymptotic Behaviour of the Sum of Martingale Differences                                                                             | 222 |
| 14. Invariance Principle for the Solution of SLAERC                                                                                       | 224 |
| 15. The Replacement of a Canonical Equation for the Solution of SLAERC                                                                    | 225 |
| 16. $G_8$ -Estimator with a Complex Regularizing Parameter                                                                                | 227 |
| 17. $G$ -Normal Estimator for the Solutions of SLAE when Observations of the Coefficients have Equivalent Variances                       | 229 |
| 18. Conditions for Vanishing of a Complex Regularizator                                                                                   | 231 |
| 19. $G$ -Normal Estimators for Solutions of SLAE when Observations of the Coefficients have Variances Equal to the Product of Some Values | 233 |
| <b>Chapter 12. <math>G_8</math>-Consistent Estimators for Solutions of SLAE with Block Structure</b>                                      | 236 |
| 1. Limit Theorems for Entries of the Resolvent of Random Matrices                                                                         | 236 |
| 2. Substitution of Truncated Block Diagonal Matrices for Block Diagonal Matrices                                                          | 241 |
| 3. Analytic Continuation of Entries of Resolvents                                                                                         | 242 |
| 4. Boundedness of Solutions of the System of $G$ -Equations                                                                               | 243 |
| 5. Random Substitution of Block Parameters                                                                                                | 244 |
| 6. $G_8$ -Estimator for Solutions of SLAE when Observations of the Coefficients have Arbitrary Variances                                  | 245 |
| 7. The Conditions for Vanishing Parameters of Complex Regularization. Consistency of the $G_8$ -Estimator                                 | 246 |
| <b>Chapter 13. <math>G_8</math>-Consistent Estimators for Solutions of SLAE with Symmetric Block Structure</b>                            | 250 |
| 1. Formulation of the Estimation Problem for the Solution of SLAE                                                                         | 250 |
| 2. Limit Theorems for Entries of the Resolvent of Random Matrices                                                                         | 251 |
| 3. Substitution of Truncated Block Diagonal Matrices for Block Diagonal Matrices                                                          | 252 |
| 4. Analytic Continuation of Entries of Resolvents                                                                                         | 253 |
| 5. Boundedness of Solutions of the System of $G$ -Equations                                                                               | 253 |
| 6. Random Substitution of Block Parameters                                                                                                | 254 |
| 7. $G_8$ -Estimator for Solutions of SLAE with Symmetric Block Structure when Observations of the Coefficients have Arbitrary Variances   | 254 |
| 8. The Conditions for Vanishing Parameters of Complex Regularization. Consistency of the $G_8$ -Estimator                                 | 255 |
| <b>Chapter 14. Self-Averaging of Solutions of the Problems of Linear Stochastic Programming of Large Dimensions</b>                       | 257 |
| 1. Formulation of the Linear Programming Problem                                                                                          | 257 |
| 2. Formulation of the Linear Stochastic Programming Problem                                                                               | 258 |
| 3. Some Aspects of General Statistical Analysis                                                                                           | 258 |
| 4. Substitution of a System of Linear Algebraic Equations for the System of Linear Inequalities                                           | 259 |

|                                                                                                                         |     |
|-------------------------------------------------------------------------------------------------------------------------|-----|
| 5. Arctangent Law                                                                                                       | 259 |
| 6. Regularized Form of LSPP                                                                                             | 260 |
| 7. The Difficulties with Random Solutions of LSPP when Real Solutions are Nonrandom                                     | 261 |
| 8. The Difficulties with Random Solutions of LSPP when Real Solutions are Random                                        | 261 |
| 9. Substitution of Nonrandom LPP for LSPP                                                                               | 261 |
| 10. Formulation of LSPP Under Conditions of General Statistical Analysis                                                | 262 |
| 11. Systems of Linear Algebraic Equations with Random Coefficients                                                      | 262 |
| 12. Limit Theorems for the Singular Values of Random Matrices                                                           | 264 |
| 13. Spectral Condition for LSPP                                                                                         | 265 |
| 14. REFORM Method for LSPP with Symmetric Matrix $A$ . Canonical Equation and Consistent Estimator for Solution of LSPP | 266 |
| 15. REFORM Method for LSPP with Nonsymmetric Matrix $A$ . Canonical Equation for LSPP                                   | 267 |
| 16. $G$ -Consistent Estimator for Solutions of LSP                                                                      | 269 |
| 17. Integral Representation Method                                                                                      | 270 |
| 18. Canonical Equation for LSPP with Independent Block Structure                                                        | 271 |
| <b>Chapter 15. Stochastic Kolmogorov-Wiener Filter</b>                                                                  | 273 |
| 1. Canonical Equation $C_1$ and Equation $L_1$ for the Extreme Points of Spectral Density                               | 274 |
| 2. Substitution of a Nonrandom Vector for the Vector of Empirical Expectation                                           | 275 |
| 3. Limit Theorem for Normalized Spectral Functions                                                                      | 276 |
| 4. Invariance Principle for the Empirical Covariance Matrix                                                             | 277 |
| 5. Equation for the Sum of Smoothed Distribution Functions of Eigenvalues of Empirical Covariance Matrices              | 278 |
| 6. The Main Assertion. Limit Theorem for Eigenvalues of the Empirical Covariance Matrix                                 | 279 |
| 7. $G_2$ -Estimator for the Stieltjes Transform of the Normalized Spectral Function of Covariance Matrices              | 280 |
| 8. Asymptotic Normality of the $G_2$ -Estimator                                                                         | 281 |
| 9. Spectral Condition for the Existence of a Solution of the Kolmogorov-Wiener Filter                                   | 281 |
| 10. The Canonical Equation                                                                                              | 282 |
| 11. The Method of Shortening Entries of Empirical Covariance Matrices                                                   | 283 |
| 12. Self-Averaging of Random Quadratic Forms                                                                            | 284 |
| 13. Existence and Uniqueness of a Solution of the Conditional Canonical Equation                                        | 286 |
| 14. Existence and Uniqueness of a Solution of the Canonical Equation                                                    | 289 |
| 15. Substitution of a Solution of the Conditional Canonical Equation for an Empirical Covariance Matrix                 | 290 |

|                                                                                                                            |     |
|----------------------------------------------------------------------------------------------------------------------------|-----|
| 16. Proof of the Main Assertion                                                                                            | 291 |
| 17. Examples of Stochastic Regularized Kolmogorov-Wiener Filters                                                           | 293 |
| 18. Consistent Estimator for the Solution of the Regularized Discrete<br>Kolmogorov-Wiener Filter with Known Free Vector   | 297 |
| 19. Consistent Estimator for the Solution of the Kolmogorov-Wiener<br>Filter with Unknown Free Vector                      | 298 |
| <b>Chapter 16. Self-Averaging of Solutions of the System of<br/>Linear Differential Equations with Random Coefficients</b> | 303 |
| 1. System of Linear Differential Equations with Random Coefficients                                                        | 303 |
