

The chemically controlled cosmos

Astronomical molecules from the Big Bang to exploding stars

T. W. HARTQUIST

Contents

<i>Preface</i>	<i>page xi</i>
<i>Acknowledgements</i>	xv
1 A brief history	1
1.1 The dawn of the field	2
1.2 New windows on the molecular composition of the cosmos	4
Selected references	7
2 Setting the astronomical scene	8
2.1 Timescales	9
2.2 Distances	11
2.3 Temperatures and densities	12
2.4 Astronomical evolution	13
Selected reference	14
3 The tools of the trade	15
3.1 Atomic energy levels: rules and regulations	15
3.2 Molecular energy levels: new freedoms	18
3.3 Vibration in molecules: more freedom, less choice	20
3.4 Rotation of molecules	22
3.5 Molecular energy levels: getting it together	23
3.6 Introduction to astrochemistry	24
3.7 Ion-molecule reactions: the fast track for chemistry	25
3.8 Neutral chemistry: change your partners!	27
3.9 Heterogeneous catalysis	28
3.10 Heating and cooling	29
3.11 The electromagnetic spectrum	31
Selected references	31
4 Chemistry after the Big Bang	32
4.1 The first chemistry in the Universe	33
4.2 Cooling and collapse: the consequences of chemistry	36

4.3	Intergalactic shocks	39
	Selected references	43
5	Interstellar clouds – the birthplaces of stars	44
5.1	The Milky Way and its nonstellar content	45
5.2	Interstellar dust: soot and sand	46
5.3	Direct observations of the gas in the different types of interstellar cloud	51
5.4	Molecular hydrogen – the key to interstellar chemistry	54
5.5	Dark clouds: chemical factories in the interstellar medium	57
5.6	Diffuse clouds: chemistry by starlight	59
5.7	Dust: the interstellar catalytic converter	60
5.8	Interstellar shocks: overcoming the chemical hump	61
5.9	Chemical influences on cloud temperatures	63
5.10	Magnetic retardation of cloud collapse in regions of stellar birth	65
5.11	Ionization in clouds – the chemical control of magnetically retarded collapse	68
5.12	The inference of the cosmic ray induced ionization rate in diffuse clouds	70
5.13	The inference of the ionization rate in dark clouds	72
5.14	Another way to find the fractional ionization in dark clouds	72
5.15	Diagnosis of conditions following the Big Bang using present day molecules	74
	Selected references	76
6	Star formation	77
6.1	The initial state clumps	78
6.2	Why are the initial state clumps stable?	80
6.3	The collapse from the initial state; core cluster formation	81
6.4	Chemical–dynamical cycling in regions of solar-like star formation	87
6.5	The infall of a core to form a star	89
6.6	Regions of massive star formation	93
	Selected references	97
7	The Solar System at birth	98
7.1	The formation of the disk	100
7.2	Lightning in the proto-Solar Nebula?	103
7.3	Where did the comets form?	106
7.4	Why does the Earth have water?	110
7.5	The Sun as a molecular source	111
	Selected references	112
8	Stellar winds and outflows	113
8.1	T Tauri winds	116

Contents

8.2	Cool stellar envelopes	118
8.3	Planetary nebulae	122
8.4	Classical novae	126
	Selected references	130
9	Astronomical masers near bright stars	131
9.1	Stimulated emission	131
9.2	Populating the upper level – pumping the maser	133
9.3	OH masers near young stars	134
9.4	H ₂ O masers near young stars	139
9.5	Masers in stellar outflows	141
	Selected references	142
10	Supernovae: fairly big bangs	143
10.1	Introduction to supernovae	143
10.2	What happens in a supernova	146
10.3	Supernova chemistry: a hydrogen-poor environment	149
	Selected references	152
11	Molecules in active galaxies	153
11.1	The black hole – accretion disk model of the central engines	154
11.2	Starburst galaxies	155
11.3	Seyfert galaxies	156
11.4	Megamasers and gigamasers	158
11.5	Molecular features in quasar spectra	160
	Selected references	160
12	Epilogue	162
	<i>Index</i>	164
