

An introduction to Bayesian networks

Finn V. Jensen

Aalborg University, Denmark

Contents

Preface	vii
1 Introduction	1
1.1 Rule based systems	2
1.2 Uncertainty	3
1.3 Normative expert systems	3
1.4 Some references for normative systems	4
2 Causal and Bayesian networks	7
2.1 Examples	7
2.1.1 Icy roads	7
2.1.2 Wet grass	8
2.1.3 Causation and reasoning	9
2.1.4 Earthquake or burglary	9
2.1.5 Prior certainties	10
2.2 Causal networks and d-separation	10
2.2.1 d-separation	12
2.3 Bayesian networks	14
2.3.1 Basic axioms	14
2.3.2 Conditional probabilities	14
2.3.3 Subjective probabilities	15
2.3.4 Probability calculus for variables	16
2.3.5 Conditional independence	17
2.3.6 Definition of Bayesian networks	18
2.3.7 The chain rule	19
2.4 The examples revisited	21
2.4.1 Icy roads	21
2.4.2 Wet grass	22
2.5 BOBLO	25
2.6 Summary	27
2.7 Bibliographical notes	29

3 Building models	33
3.1 Catching the structure	33
3.1.1 Family out?	33
3.1.2 A simplified poker game	35
3.1.3 Insemination	36
3.1.4 Simple Bayes models	37
3.1.5 Causality	38
3.2 Determining the conditional probabilities	38
3.2.1 Stud farm	38
3.2.2 Conditional probabilities for the poker game	41
3.2.3 Transmission of symbol strings	44
3.2.4 Family out?	46
3.3 Modelling tricks	47
3.3.1 Undirected relations	47
3.3.2 Noisy or	48
3.3.3 Causal independence	50
3.3.4 Divorcing	52
3.4 Learning	53
3.4.1 Batch learning	53
3.4.2 Distance measures	54
3.4.3 Search for possible structures	55
3.4.4 Statistical methods	57
3.4.5 Adaptation	57
3.5 Child	59
3.6 Summary	61
3.7 Bibliographical notes	63
4 Propagation in Bayesian networks	69
4.1 An algebra of belief tables	69
4.1.1 Multiplication and division	70
4.1.2 Marginalization	70
4.2 Probability updating in joint probability tables	71
4.3 Cluster trees	72
4.3.1 Absorption in cluster trees	73
4.3.2 Message passing in cluster trees	75
4.4 Junction trees	76
4.4.1 HUGIN propagation	79
4.5 Construction of junction trees	80
4.5.1 Singly connected DAGs	80
4.5.2 Coping with cycles	82
4.5.3 From DAG to junction tree	84
4.6 Stochastic simulation	87
4.7 Summary of Sections 4.2–4.5	91
4.8 Bibliographical notes	93

5	Use of Bayesian network models	99
5.1	Joint probabilities	99
5.1.1	Two variables	100
5.1.2	An arbitrary set of variables	101
5.1.3	Formalization of variable propagation	102
5.2	Configuration of maximal probability	104
5.3	Data conflict	107
5.3.1	Seismometer	107
5.3.2	The conflict measure (conf)	108
5.3.3	Tracing of conflicts	109
5.3.4	Conflict or rare case	110
5.3.5	Other approaches to conflict detection	111
5.4	Sensitivity analysis	112
5.4.1	Example and definitions	112
5.4.2	Cautious propagation	115
5.4.3	"What if"-questions, the set of crucial findings and minimal sufficient sets of findings	118
5.4.4	Redundancy and irrelevance	120
5.5	Value of information	121
5.5.1	Example	121
5.5.2	Hypothesis driven data request	123
5.5.3	Non-myopic data request	126
5.6	Pathfinder	127
5.7	Bibliographical notes	129
6	Actions	133
6.1	Utilities	134
6.1.1	The oil wildcatter	135
6.1.2	Management of effort	137
6.2	Non-intervening actions	139
6.2.1	Several sets of non-intervening actions	143
6.3	Intervening actions	144
6.3.1	One set of intervening actions	144
6.3.2	Several sets of intervening actions	147
6.4	Sequences of actions	148
6.4.1	Information and actions	148
6.4.2	Mildew examples	150
6.5	Summary	152
6.6	Bibliographical notes	154
A	Construction of junction trees (proofs)	159
B	Value of information (proofs)	163
	Bibliography	167
	Index	175
