|                                                                                              |           |
|----------------------------------------------------------------------------------------------|-----------|
| Preface .....                                                                                | ix        |
| <b>Chapter 1 Introduction .....</b>                                                          | <b>1</b>  |
| References .....                                                                             | 4         |
| <b>Chapter 2 Molecular Force Field .....</b>                                                 | <b>5</b>  |
| 2. 1 Outline of the Method of Calculation .....                                              | 5         |
| 2. 2 Generation of initial Nuclear Coordinates .....                                         | 6         |
| 2. 3 Calculation of Internal Variables .....                                                 | 10        |
| 2. 3. 1 Bond Lengths, Bond Angles and Torsion Angles .....                                   | 10        |
| 2. 3. 2 Out-of-plane Angles .....                                                            | 14        |
| 2. 3. 3 Linear Angle Bending .....                                                           | 17        |
| 2.4 General Properties of Potential Energy Functions .....                                   | 19        |
| 2. 4. 1 Partition of the Potential Energy .....                                              | 19        |
| 2. 4. 2 Interaction Force Constants and Intramolecular Strains .....                         | 22        |
| 2. 4. 3 Invariance of Compliance Constants .....                                             | 26        |
| 2. 5 Modeling of Local Potential Functions .....                                             | 28        |
| 2. 5. 1 Potential Models for Non-infinitesimal Variables .....                               | 28        |
| 2. 5. 2 Bond Stretching Potential .....                                                      | 29        |
| 2. 5. 3 Exchange Repulsion and Dispersion Potential .....                                    | 31        |
| 2. 5. 4 Coulomb Interaction Potential .....                                                  | 37        |
| 2. 5. 5 Angle Bending Potential .....                                                        | 38        |
| 2. 5. 6 Torsional Potential .....                                                            | 40        |
| References.....                                                                              | 42        |
| <b>Chapter 3 Equilibrium Structure of Molecules .....</b>                                    | <b>45</b> |
| 3. 1 Expansion of Potential Functions in Cartesian Displacement Coordinates .....            | 45        |
| 3. 2 Separation of Translation and Rotation .....                                            | 47        |
| 3. 3 Transformation between the Internal and the<br>Cartesian Displacement Coordinates ..... | 53        |
| 3. 4 Method of Steepest Descent .....                                                        | 62        |
| 3. 5 The Conjugate Gradient Method .....                                                     | 66        |
| 3. 6 Search for Multim minima .....                                                          | 71        |
| References .....                                                                             | 74        |
| <b>Chapter 4 Normal Coordinate Analysis .....</b>                                            | <b>75</b> |
| 4. 1 Harmonic Approximation .....                                                            | 75        |

|                                                                                    |            |
|------------------------------------------------------------------------------------|------------|
| 4. 2 Normal Vibrations .....                                                       | 75         |
| 4. 3 The <i>GF</i> Matrix Method .....                                             | 78         |
| 4. 4 Quantum Mechanics of Harmonic Oscillators .....                               | 83         |
| 4. 5 Use of Molecular Symmetry .....                                               | 88         |
| 4. 6 Molecular Point Groups .....                                                  | 92         |
| 4. 7 Characters of Irreducible Representations .....                               | 103        |
| 4. 8 Computer Program to Generate Symmetry Coordinates .....                       | 105        |
| References .....                                                                   | 112        |
| <b>Chapter 5 Rotations and Anharmonic Vibrations of Molecules .....</b>            | <b>113</b> |
| 5. 1 Anharmonicity of Molecular Potential Functions .....                          | 113        |
| 5. 2 Nuclear Kinetic Energies of Molecules .....                                   | 113        |
| 5. 3 Perturbation Theory of Anharmonic Vibrations .....                            | 122        |
| 5. 4 Anharmonicity Constants and Anharmonic Resonances .....                       | 128        |
| 5. 5 Rotational Energy Levels and Vibration-Rotation Interaction .....             | 135        |
| 5. 6 Average Internuclear Distances .....                                          | 140        |
| 5. 7 Nonlinear Transformation of Anharmonic Potential .....                        | 146        |
| References .....                                                                   | 151        |
| <b>Chapter 6 Thermodynamic Functions .....</b>                                     | <b>152</b> |
| 6. 1 Thermodynamic Functions and Molecular Force Field .....                       | 152        |
| 6. 2 Partition Function .....                                                      | 152        |
| 6. 3 Translation, Rotation and Vibration .....                                     | 156        |
| 6. 4 Internal Rotation .....                                                       | 160        |
| 6. 5 Thermodynamic Functions of Equilibrium Mixtures .....                         | 162        |
| 6. 6 Internal Energies Measured from Dissociation States .....                     | 165        |
| 6. 7 Calculation of Thermodynamic Functions by Empirical Rules of Additivity ..... | 167        |
| 6. 8 Correction for Vibrational Anharmonicity .....                                | 169        |
| References .....                                                                   | 172        |
| <b>Chapter 7 Electric Properties of Molecules .....</b>                            | <b>173</b> |
| 7. 1 Point Charge Model of Molecules .....                                         | 173        |
| 7. 2 Multipole-Multipole Interaction .....                                         | 173        |
| 7. 3 Estimation of Effective Atomic Charges .....                                  | 180        |
| 7. 4 Induced Dipole Moments and Polarizabilities .....                             | 185        |
| 7. 5 Atomic Charge Model and Bond Moment Model .....                               | 190        |
| 7. 6 Nuclear Charges and Charge Fluxes .....                                       | 191        |
| References .....                                                                   | 193        |
| <b>Chapter 8 Simulation of Vibrational Spectra .....</b>                           | <b>194</b> |
| 8. 1 Interaction between Molecules and Electromagnetic Waves .....                 | 194        |
| 8. 2 Infrared Absorption Intensity Parameters .....                                | 196        |
| 8. 3 Raman Scattering Intensity Parameters .....                                   | 198        |
| 8. 4 Spectral Intensity Distributions .....                                        | 204        |
| 8. 5 Selection Rules .....                                                         | 207        |
| 8. 6 Illustrative Simulation of Vibrational Spectra .....                          | 210        |

|                                                                                                                                                      |     |
|------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| References .....                                                                                                                                     | 213 |
| <b>Chapter 9 Mechanics of Molecular Crystals</b> .....                                                                                               | 214 |
| 9. 1 Molecular Force Field and Crystal Force Field .....                                                                                             | 214 |
| 9. 2 Equilibrium Structures and Elastic Constants of Crystals . ....                                                                                 | 214 |
| 9. 3 Crystal Vibrations .....                                                                                                                        | 226 |
| 9. 3. 1 Normal Vibrations and Vibrational Spectra of Molecular Crystals .....                                                                        | 226 |
| 9. 3. 2 Anisotropic Temperature Factors in X-ray Diffraction by Crystals . ....                                                                      | 238 |
| 9. 3. 3 Rigid Molecule Approximation .....                                                                                                           | 249 |
| 9. 3. 4 Temperature Diffuse Scattering of X-ray by Crystals .....                                                                                    | 252 |
| 9. 3. 5 Thermodynamic Functions .....                                                                                                                | 255 |
| 9. 3. 6 Cross Sections of Inelastic Scattering of Neutrons by Crystals .....                                                                         | 257 |
| 9. 4 Lattice Energies of Static Crystals .....                                                                                                       | 263 |
| 9. 5 Surface Energies .....                                                                                                                          | 270 |
| References .....                                                                                                                                     | 274 |
| <b>Appendix</b> .....                                                                                                                                | 276 |
| Appendix 1 The Cosine Theorem in Spherical Trigonometry .....                                                                                        | 276 |
| Appendix 2 Matrix Elements of the Coordinates and Momenta with the Wave Functions<br>for Harmonic Oscillators .....                                  | 277 |
| Appendix 3 The Matrix of Inverse Transformation of $\mathbf{r} = \mathbf{C}\mathbf{r}_c$ .....                                                       | 279 |
| Appendix 4 Average of Exponential Function of a Random Variable .....                                                                                | 281 |
| Appendix 5 Laue Function and Periodic Delta function .....                                                                                           | 284 |
| Appendix 6 Evaluation of Debye Function .....                                                                                                        | 286 |
| Appendix 7 Coherent and Incoherent Neutron Scattering by Crystals .....                                                                              | 289 |
| Appendix 8 Evaluation of the Integral $(I_{Jp,Kj}^a)_{n,n+s}$ and the Thermal Average<br>of the Square of its Absolute Value $(J_{Jp,Kj}^a)_s$ ..... | 296 |
| Appendix 9 Structure Factor and Patterson Function for Coulomb Potential .....                                                                       | 300 |
| Appendix 10 Three-Dimensional Fourier Transform of the Function $\gamma(n, \pi r^2)/r^{2n}$ ....                                                     | 302 |
| Appendix 11 Differentiation of the Coulomb Potential in Crystals and TO-LO<br>Splitting .....                                                        | 306 |
| Addendum .....                                                                                                                                       | 311 |
| Subject Index .....                                                                                                                                  | 313 |
