Contents

1. Mutagenesis facilitated by the removal or introduction of unique restriction sites	1
<i>P. Carter</i>	
1. Introduction to site-directed mutagenesis	1
Mutagenesis using mismatched oligonucleotides	1
Factors reducing yield	2
Strategies to enhance mutant yield	4
Phagemid vectors	5
Design of mutagenic oligonucleotide primers	6
Choice of endonuclease for restriction-selection and restriction-purification	8
Methods included in this chapter	9
2. Oligonucleotide-directed mutagenesis facilitated by using repair deficient host strains and restriction-selection or restriction-purification	9
Enzymes	9
Other reagents	9
Bacterial and phage strains	10
Media	10
Preparation of single-stranded phagemid DNA	10
Construction of site-directed mutations	11
3. Trouble-shooting procedures	19
Likely origin of clones other than target mutant	19
Checks on the efficiency of mutagenesis	20
Specificity of priming of mutagenic oligonucleotide	21
Purity of mutagenic oligonucleotide	21
Extent of phosphorylation of mutant oligonucleotide	21
4. Advantages and limitations of restriction-selection and restriction-purification	22
Acknowledgements	23
References	23

2. Site-directed in vitro mutagenesis using uracil-containing DNA and phagemid vectors	27
<i>P. D. Yuckenberg, F. Witney, J. Geisselsoder, and J. McClary</i>	
1. Introduction	27
2. Mutagenesis procedures	31
Bacteriology	31
Introduction of phagemid into <i>E. coli</i> CJ236	32
Isolation of uracil-containing phagemid particles	36
Extraction of phagemid DNA	38
Synthesis of the mutagenic strand	39
Use of T4 gene 32 protein	45
Gel analysis of the reaction products	46
Transformation of the reaction mixture	46
Analysis of transformants by DNA sequencing	47
References	47
3. Phosphorothioate-based site-directed mutagenesis for single-stranded vectors	49
<i>J. Sayers and F. Eckstein</i>	
1. Introduction	49
Development of the methodology	50
2. Mutagenesis procedure	50
Preparation of single-stranded template DNA	50
The mismatch oligonucleotide	54
Preparation of RF-IV DNA	55
Filtration through nitrocellulose	57
Nicking reaction	58
Gapping reaction	59
Preparation of the mutant homoduplex: the repolymerization step	62
Transfection	62
3. Monitoring the procedure and debugging	64
4. Modifications of the basic system	66
5. Scope and limitations of the procedure	67
References	68

4. Site-directed mutagenesis using gapped-heteroduplex plasmid DNA	71
<i>S. Inouye and M. Inouye</i>	
1. Introduction	71
2. The plasmid mutagenesis method	72
Preparation of plasmid DNA fragments I and II	72
Design and preparation of oligonucleotides	75
Denaturation and renaturation	76
Primer extension and transformation	77
Screening and confirmation of the mutations	78
3. Concluding remarks	81
References	82
5. Phosphorothioate-based double-stranded plasmid mutagenesis	83
<i>D. B. Olsen and F. Eckstein</i>	
1. Introduction	83
2. Overview of the methodology	83
Preparation of the double-stranded DNA templates	84
Preparation of mutant heteroduplex	88
Creation of the mutant homoduplex	93
Transformation of the mutant DNA	96
3. Monitoring the procedure by agarose gel electrophoresis	97
4. Discussion	98
Acknowledgements	98
References	99
6. Linker scanning mutagenesis	101
<i>B. Luckow and G. Schütz</i>	
1. Introduction	101
Definition of linker scanning mutagenesis	101
Different strategies for the construction of linker scanning mutations	101
Alternative scanning mutagenesis procedures	102
2. Construction of linker scanning mutants	104
Apurination of plasmid DNA by formic acid	104
Generation of nicks and small gaps in apurinic DNA by exonuclease III	105
Linearization of nicked or gapped plasmid DNA by nuclease S1	106

Contents

Ligation of linkers	108
Generation of DNA pool I	111
Generation of DNA pool II	115
Removal of the kanamycin resistance fragment	117
Size fractionation of mutated inserts	119
Identification of putative linker scanning mutations on the basis of the topoisomer pattern	123
3. General aspects of linker scanning mutagenesis	129
Selecting a suitable DNA fragment	129
Selecting a suitable vector	129
Selecting a suitable linker	130
Essential steps	130
Potential problems	130
Advantages	131
Time requirements	132
Acknowledgements	132
References	132
 7. Random chemical mutagenesis and the non-selective isolation of mutated DNA sequences in vitro	 135
<i>C. Walton, R. K. Booth, and P. G. Stockley</i>	
1. Introduction	135
2. Applications of random chemical mutagenesis	135
Random versus directed mutagenesis <i>in vitro</i>	135
3. Chemistry of random mutagenesis <i>in vitro</i>	136
Background to chemical mutagenesis <i>in vitro</i>	136
Nitrous acid mutagenesis	137
Hydroxylamine mutagenesis	137
Bisulphite mutagenesis	137
Hydrazine mutagenesis	137
Acid depurination of DNA	138
4. Practical considerations for random chemical mutagenesis	138
Vector damage	138
Distribution of induced mutations	139
Considerations in the choice of target fragment(s)	139
Vectors for mutagenesis of single-stranded DNA	141
Mutagenic procedures	143
Regeneration of duplex DNA from treated single-stranded DNA	145
Amplification and enrichment of treated sequences	146
Nature of the mutations generated	148

Contents

5. Electrophoretic techniques allowing the enrichment of mutants	149
Theory of denaturing gradient gel electrophoresis (DGGE)	150
Apparatus	151
Determination of optimum conditions for DGGE	153
Preparative denaturing gels	159
Analytical denaturing gradient gel electrophoresis	160
References	161
 8. An enzymatic method for the complete mutagenesis of genes	 163
<i>J. K. C. Knowles and P. Lehtovaara</i>	
1. Introduction	163
Other random mutagenesis methods	163
2. Principle of the method	164
Advantages of the method	165
3. Practical aspects of the method	166
Isolation of template DNA	166
Base-specific limited elongation	167
Misincorporation and elongation	170
Transformation	172
Mutant characterization	172
4. Conclusions	173
References	174
 9. Spiked oligonucleotide mutagenesis	 177
<i>S. C. Blacklow and J. R. Knowles</i>	
1. Introduction	177
Overview and theory	177
Strategy for spiked oligonucleotide-directed mutagenesis	182
2. Materials	182
Buffers and solutions	182
Media	184
Bacterial strains	184
3. Procedures	185
Preparation of oligonucleotides for mutagenesis	185
Preparation of single-stranded template (for mutagenesis)	189
Oligonucleotide-directed mutagenesis	192
Preparation of competent cells and transformation	192
Determination of mutagenesis efficiency by sequencing	194
Amplification of mutant plasmid DNA	196

Contents

4. Summary	198
Acknowledgements	198
References	198
10. Cassette mutagenesis	199
<i>J. H. Richards</i>	
1. Introduction	199
2. Requirement for restriction sites	200
3. Preparation of vector to receive a cassette	201
Restriction digest of plasmid DNA	202
4. Preparation of cassette for insertion	203
Discrete sequence cassette	204
Multiple sequence cassette	205
Preparation of double-stranded cassettes	208
5. Ligation	212
6. Transformation	213
References	214
11. Recombination and mutagenesis of DNA sequences using PCR	217
<i>R. M. Horton and L. R. Pease</i>	
1. Introduction	217
The third generation of recombinant DNA technology	218
Synthetic applications of PCR	218
2. Overlap extension	218
Mechanism	218
Mutagenesis	222
Recombination	222
What happens to the non-productive strands?	225
3. Examples of overlap extension applications	226
Mutagenesis	226
Recombination	228
4. Planning a strategy	228
Is PCR the solution to your problem?	228
Oligonucleotide design	231
Establishing a cassette system	235
5. Procedures	236
Purifying the oligonucleotides	236
Determining the amount of primer to add	236
