Statistical Physics

A Prelude and Fugue for Engineers

 Springer

Contents

1	Prelude: playing by ear	1
1.1	Time: an arrow or a boomerang?	2
1.1.1	“And yet it stops”: equilibrium, the Holy Grail of thermodynamics	3
1.1.2	Thermodynamics: a bold and possibly paradoxical science	8
1.2	Temperature	9
1.2.1	Thermodynamic systems	9
1.2.2	The Zeroth Law	10
1.3	Work and internal energy	12
1.3.1	Work by compression or expansion	14
1.3.2	Elastic and plastic deformation	14
1.3.3	Work and surface tension	15
1.3.4	Electric and magnetic work on solids	20
1.3.5	Generalized forces and displacements	21
1.4	Entropy, the movie star	22
1.4.1	The nature of heat	22
1.4.2	The Second Law: an offense to equal opportunities	23
1.4.3	Entropy, the scales of heat	25
1.4.4	Irreversibility and the Second Law	27
1.4.5	The Third Law	29
1.5	Other characters (in order of appearance)	30
1.5.1	Free energy	30
1.5.2	Chemical potential	32
1.5.3	Extensivity and homogeneity	33
1.5.4	Some extras to suit all tastes	34
1.6	Brownian motion, the <i>Perpetuum Mobile</i>	36
2	Overture in B major	39
2.1	Some clues and a first identikit	39
2.1.1	Thermodynamics of the ideal gas	39

2.1.2	Free expansion of a gas	41
2.1.3	Isothermal heat transfer	43
2.1.4	Adiabatic compression	44
2.2	From macroscopic to microscopic	45
2.2.1	The world of Newton's apples	46
2.2.2	The world of Schrödinger's cats	51
2.2.3	Microstates versus macroscopic state	56
2.3	Boltzmann and the treble clef	62
2.4	A "Smaller Vehicle": the microcanonical distribution	64
2.4.1	The classical microcanonical distribution	66
2.4.2	Back to thermodynamics	67
2.5	A simple (but nontrivial) application	72
2.5.1	The Gibbs' paradox	74
2.5.2	Identical particles and the Maxwell-Boltzmann approximation	75
3	Easy rhythms and melodies	81
3.1	A "Greater Vehicle": the canonical distribution	81
3.1.1	Mean values and fluctuations	84
3.1.2	The free energy	86
3.1.3	Probability distribution for the fluctuations	87
3.1.4	Canonical distribution: the Gibbs perspective	89
3.2	Systems of independent particles	90
3.2.1	Identical but <i>distinguishable</i> particles	91
3.2.2	Indistinguishable particles	92
3.2.3	The Maxwell-Boltzmann approximation	95
3.2.4	The classical partition function	96
3.3	The ideal gas	97
3.3.1	Ideal monoatomic gas	97
3.3.2	Polyatomic gases: an outline	99
3.4	The specific heat of solids	105
3.4.1	Statistical democracy: the equipartition theorem	108
3.4.2	The low temperature enigma	111
3.4.3	The Einstein model	112
3.4.4	Collective vibrations	115
3.4.5	The Debye model	118
3.5	Paramagnetic solids	123
3.5.1	The classical Langevin model	125
3.5.2	Quantum Description	127
3.5.3	Heat capacity of a paramagnet	128
3.5.4	Magnetic cooling	129
3.5.5	Apparent negative temperatures	131
3.5.6	An elementary classical model of diamagnetism	133
3.5.7	The chimera of classical magnetism	135

4	Fluid chords	141
4.1	Two-faced Janus: the ambivalent nature of fluids	141
4.1.1	The configuration integral	144
4.1.2	The mean-field approach	146
4.1.3	Effective potential and partition function	147
4.1.4	The van der Waals equation of state	150
4.1.5	Free energy and phase coexistence	153
4.1.6	Intermezzo: statistics under pressure	155
4.1.7	Phase coexistence and nucleation processes	159
4.2	From plasmas to DNA: charged fluids	165
4.2.1	The Poisson-Boltzmann equation	169
4.2.2	The Debye-Hückel equation	171
4.2.3	Debye-Hückel potential and charge distribution	173
4.2.4	Effective potential and thermodynamic properties	175
*4.3	The microscopic structure of liquids	178
*4.3.1	Pair distribution function	178
*4.3.2	Partition function and correlations	180
*4.3.3	Pair correlations and thermodynamics	185
*4.3.4	Real gases: the virial expansion	188
*4.3.5	Scattering and liquid structure	189
*4.3.6	Structure of a hard-sphere system	194
*4.3.7	Order without attraction: the hard-sphere crystal	196
5	A crescendo of scales	201
5.1	Ferromagnetism	202
5.1.1	Phenomenological aspects	202
5.1.2	Out of the magnetic maze: ferromagnetic domains	204
5.1.3	At the roots of ferromagnetism	208
5.1.4	The Weiss-Heisenberg model	218
5.1.5	Critical exponents	223
5.2	Critical landscapes	225
5.2.1	Spontaneous symmetry breaking	225
5.2.2	Critical points and universality	228
5.2.3	Other critical issues	229
5.2.4	Landau's general model	233
*5.3	Beyond mean-field	237
*5.3.1	Fluctuations: the Landau-Ginzburg approach	238
*5.3.2	The Ising model	246
*5.3.3	Scaling relations	250
*5.3.4	Block transformation and renormalization	254
6	Outdoor music	259
6.1	Open systems	259
6.1.1	The grand canonical distribution	261
6.1.2	Grand potential	263

6.1.3	The thermodynamic limit	264
6.2	Surface adsorption	265
6.3	Inhomogeneous systems	268
*6.4	Fluctuations and structure in liquids	272
6.5	Concerto grosso in Middle-earth	273
6.5.1	Colloidal interactions	274
6.5.2	Osmotic pressure and the van 't Hoff Law	276
6.5.3	The effective potential	280
*6.5.4	A semi-open perspective	282
6.5.5	Specific interactions	284
6.5.6	Colloid sedimentation	285
7	Fuzzy and cool melodies	291
7.1	Parting the perfect peers: quantum statistics	292
7.1.1	The Fermi–Dirac distribution	293
7.1.2	Bose–Einstein distribution	294
7.1.3	The classical limit	294
7.1.4	Weakly degenerate gases	295
7.2	Lonely fermions	297
7.2.1	The Fermi factor	298
7.2.2	The fully degenerate gas	300
7.2.3	Grand potential	301
7.2.4	Qualitative trend of the chemical potential	302
7.2.5	The Sommerfeld expansion ($T \ll T_F$)	303
7.2.6	Electrons in metals (hints)	307
7.3	Genial bosons	316
7.3.1	The Bose factor	316
7.3.2	The Bose–Einstein condensation (BEC)	320
7.3.3	BEC as a phase transition	323
7.3.4	Trapped atoms: making the BEC true	326
*7.3.5	Pairing the lonely hearts: fermionic condensates	334
7.4	Inconstant photons	337
7.4.1	Total energy and the Stefan–Boltzmann law	339
7.4.2	Average photon number and Planck's law	339
7.4.3	Equation of state and entropy of the photon gas	340
7.5	Swift superfluids	341
7.5.1	Special effects in He II	342
7.5.2	The Tisza–Landau model	345
7.5.3	Excitations and vortices in superfluids	348
*7.5.4	Superfluid helium–3 (hints)	351
7.6	Fugue	353

A	Mathematical notes	355
A.1	Combinatorics	355
A.1.1	Counting different objects	355
A.1.2	Counting identical objects	361
A.1.3	The Stirling approximation	363
A.2	Probability distributions	366
A.2.1	Distributions for discrete variables	366
A.2.2	Continuous variables and probability densities	370
A.2.3	The binomial distribution	374
A.2.4	The Poisson distribution	376
A.2.5	The Gaussian distribution and the Central Limit Theorem	380
A.3	Useful functions (and false friends)	383
A.3.1	The gamma function	383
A.3.2	The Riemann zeta function	385
A.3.3	The Dirac delta	388
A.4	Useful integrals	392
A.5	Functionals and functional derivatives (hints)	394
A.5.1	Functionals	396
A.5.2	Functional derivatives	397
B	The rest is noise: listening to random music	403
B.1	Entropy and information	404
B.2	The problem of continuous variables	408
C	Roots	411
C.1	Boltzmann's equation and the <i>Stosszahlansatz</i>	411
C.2	Reversibility and initial conditions	416
C.3	Ever-recurring cycles: Zermelo's objection	420
C.4	Irreversibility and macroscopic properties	421
C.5	Irreversibility and "chaos"	425
C.6	Kac's irreversible clock	426
D	Dancing with background music	433
D.1	Random walks	433
D.2	The diffusion equation	435
*D.3	The Langevin equation	437
E	Scattered notes	441
E.0.1	Scattering of identical particles	442
E.0.2	Detailed balance	446
	Index	449
