

Hanieh Fattahi

Third-Generation Femtosecond Technology

Doctoral Thesis accepted by
the Max Planck Institute for Quantum Optics, Germany

Contents

1	Introduction	1
	References	10
2	How to Amplify Photons	13
2.1	Optical Parametric Amplification (OPA)	14
2.2	Yb:YAG Based OPCPA Systems	33
2.3	Tunable OPCPA	40
	References	43
3	Broadband Seed Generation	45
3.1	Spectral Broadening in Large Mode Area Fibers	46
3.2	Supercontinuum Generation in Hollow Core Fiber	50
3.3	Cross-Polarized Wave Generation	50
3.4	Difference Frequency Generation	60
	References	69
4	Regenerative Amplifiers	73
4.1	Yb:YAG Thin-Disk Regenerative Amplifier	73
4.2	Second Harmonic Generation	83
	References	85
5	Experimental OPCPA	87
5.1	Reusing the Pump	88
5.2	Temporal Allocation of Pump Intensity Remainder (TAPIR)	94
5.3	Bandwidth Engineering	99
5.4	XPW Seeded OPCPA System	105
	References	106
6	Design of a Multi-terawatt Field Synthesizer (LWS-pro)	107
6.1	Proposed Multi-octave Seed Generation	109
6.2	Synthesizer Channels	112

6.3	Field Synthesizer	118
6.4	Prospects for Experiments	120
	References	124
7	Conclusion and Outlook	127
	Appendix A: In Situ Spectral Interferometry as a Pulse Compression Tool	131
	Appendix B: Toolbox and Ideas.	135
	Appendix C: Simulation Details of Fig. 1.2.	137
	Appendix D: 1-ps-Pumped Supercontinuum Generation	139
