

Contents

1 Background and motivation	1
1.1 Chemicals in the aquatic environment	1
1.2 Fish embryo acute toxicity (FET) test: advantages, applications, and limitations	2
1.3 Neuroactive chemicals: Outside the applicability domain of the FET test.....	3
1.4 Behaviors in embryonic and early larval stage of zebrafish as potential endpoint in ecotoxicology.....	3
1.5 Aim of the thesis: Behavior-based identification of environmentally relevant chemicals and related modes of action	5
1.5.1 Establishment of a light-dark transition assay in larval zebrafish: Which parameters need to be considered?	7
1.5.2 Behavioral profiling of environmental chemicals: Are locomotor responses to chemical exposure indicative of modes of action?	8
1.5.3 Evaluation of underlying mechanisms: What is the biological background of chemical-induced hyperactivity?	10
1.5.4 Combined effects of chemicals on locomotor activity: Is a combined effect on locomotion predictable from single compounds' effects and can individual behavioral profiles be recovered from profiles of mixture exposure?	10
2 Establishment of a light-dark transition assay in larval zebrafish for the assessment of environmental chemicals	17
2.1 Introduction	18
2.2 Materials and methods	21
2.2.1 Fish culture and embryo collection	21
2.2.2 Chemicals and stock preparation	21
2.2.3 Determination of fish embryo acute toxicity and concentration-response modelling.....	21
2.2.4 Locomotor response assay	22
2.2.5 Statistical analyses and hierarchical clustering.....	22
2.3 Results	23
2.3.1 The diurnal rhythm of newly hatched zebrafish larvae	23
2.3.1 Experimental parameters alter light-dark transition behavior	23
2.3.3 Chemical-induced behavioral alterations depend on various exposure settings.....	23
2.3.4 Developmental exposure affects zebrafish morphology.....	28
2.4 Discussion	29

2.4 Discussion	29

3 Can environmentally relevant neuroactive chemicals be detected specifically with the locomotor response assay in zebrafish larvae? 39

3.1 Introduction..... 39

3.2 Materials and methods 41

3.2.1 Fish cultivation, embryo collection, chemicals and stock preparation..... 41

3.2.2 Experimental design and determination of exposure concentrations 41

3.2.3 Exposure and light-dark transition locomotor response assay 41

3.2.4 Analysis of locomotor activity data..... 42

3.2.5 Multidimensional scaling (MDS) and cluster analysis..... 42

3.3 Results 42

3.3.1 Concentration and time dependency of behavioral profiles..... 44

3.3.2 Behavioral phenotype-based clustering of chemicals 45

3.3.3 Sensitivity of locomotor responses in relation to lethal acute toxicity 49

3.4 Discussion..... 54

4 Co-occurrence of acetylcholinesterase inhibition and bradycardia is associated but not causally linked with hyperlocomotion in zebrafish larvae after chemical exposure 65

4.1 Introduction..... 65

4.2 Materials and methods 67

4.2.1 Fish cultivation and embryo collection 67

4.2.2 Chemicals and stock preparation..... 68

4.2.3 Exposure and pre-incubation 68

4.2.4 Light-dark transition assay and analysis of locomotor activity data 68

4.2.5 Quantification of acetylcholinesterase activity..... 69

4.2.6 Heart rate determination..... 69

4.2.7 Hierarchical clustering and multidimensional scaling 70

4.3 Results 70

4.3.1 Acetylcholinesterase inhibitors and herbicides cause a hyperactive locomotor phenotype 70

4.3.2 Inhibition of acetylcholinesterase is not correlated with hyperlocomotion..... 72

4.3.3 Acetylcholinesterase inhibitors and herbicides cause bradycardia..... 75

4.3.4 Cardiosensitive drugs only partially copy hyperactive phenotypes 76

4.3.5 Heart rate and locomotor activity are partially co-regulated 78

4.4 Discussion..... 78

3 Can environmentally relevant neuroactive chemicals be detected specifically with the locomotor response assay in zebrafish larvae? 39

3.1 Introduction..... 39

3.2 Materials and methods 41

 3.2.1 Fish cultivation, embryo collection, chemicals and stock preparation..... 41

 3.2.2 Experimental design and determination of exposure concentrations 41

 3.2.3 Exposure and light-dark transition locomotor response assay 41

 3.2.4 Analysis of locomotor activity data..... 42

 3.2.5 Multidimensional scaling (MDS) and cluster analysis..... 42

3.3 Results 42

 4.3.3 Acetylcholinesterase inhibitors and herbicides cause bradycardia..... 75

 4.3.4 Cardiosensitive drugs only partially copy hyperactive phenotypes 76

 4.3.5 Heart rate and locomotor activity are partially co-regulated 78

4.4 Discussion..... 78

5 Combined effects of chemical mixtures on locomotor activity: Prediction and diagnostic potential of behavioral alterations in larval zebrafish	91
5.1 Introduction	91
5.2 Materials and methods	93
5.2.1 Fish cultivation and embryo collection	93
5.2.2 Chemicals and stock preparation	93
5.2.3 Mixture design and mixture effect prediction.....	94
5.2.4 Exposure, locomotor response assay, and data analysis	95
5.2.5 Multidimensional scaling.....	95
5.2.6 Quantification of acetylcholinesterase activity, heart rate, and morphological features	95
5.3 Results	96
5.3.1 Classical concentration response models are applicable to locomotor activity	96
5.3.2 Mixtures of chemicals act additively on locomotor activity	97
5.3.3 Design of an environmentally relevant mixture to examine the diagnostic potential of locomotor response patterns.....	100
5.3.4 Determination of COX inhibitor-specific behavioral phenotypes	101
5.3.5 Behavioral phenotypes determined with a quinary mixture of chemicals resemble distinct profiles of individual components	103
5.4 Discussion	105
 6 Conclusions and future perspectives.....	 115
6.1 Behavioral endpoints in the effect-based assessment of chemicals and mixtures ..	116
6.2 Diagnostic capacity of behavioral phenotypes	119
 Appendix	 123
