Deutsche Zusammenfassung	1
1 Introduction	5
2 Experimental and theoretical background	9
2.1 Magnetism	9
2.1.1 Theoretical description of ferromagnets	10
2.1.2 The tunneling magnetoresistance	12
2.1.3 The giant magnetoresistance	15
2.1.4 The Kondo effect	17
2.2 Principles of the scanning tunneling microscope	18
2.2.1 Theoretical description of the tunneling effect	19
2.2.2 Tunneling spectroscopy	23
2.2.3 Spin-polarized scanning tunneling microscopy	24
2.3 Molecular electronics	28
2.3.1 Measuring the transport properties of single molecules	28
2.3.2 Realized single molecular devices	31
2.3.3 Magnetotransport in organic and molecular electronics	32
3 Materials and methods	33
3.1 Experimental setup	33
3.1.1 STM chamber	34
3.1.2 Preparation chamber	36
3.2 Substrates and Tips	38
3.3 Molecules	42
3.3.1 Phthalocyanine molecules	42
3.3.2 Acetylacetonates	44
3.4 STM-measuring method: obtaining current-distance curves	45

4	Non-magnetic transport properties of single phthalocyanines	49
4.1	Growth of the phthalocyanines	50
4.2	Influence of the central atom on the transport	51
4.2.1	Metal free phthalocyanines on the Cu substrate	52
4.2.2	CoPc and MnPc on the Cu substrate	54
4.2.3	Changing the molecular orbitals: the influence of the cation	55
4.3	Influence of the surface on the transport	58
4.3.1	H ₂ Pc and CoPc on Co islands	58
4.3.2	The LDOS on the different substrates	60
4.4	The process of forming the contact: soft vibron excitation	62
5	Giant magnetoresistance of single phthalocyanine molecules	65
5.1	The magnetoresistance of Co/H ₂ Pc/Co junctions	66
5.2	Mn/H ₂ Pc/Fe junctions: optimization of the GMR	73
6	Growth and electronic properties of Chromium acetylacetonate	77
6.1	Deposition and growth	78
6.2	Electronic properties	80
7	Conclusions and outlook	87
	Bibliography	93
	Acknowledgments	109
